

Figure 1. Viability of the three commensal bacteria species in bacteria culture medium and cell culture medium. *F. prausnitzii*, *B. faecis* and *R. intestinalis* in stationary phase suspended in anaerobic DMEM (CM) and supplemented YBHI (BM) and incubated anaerobically at 37°C for 12 hours. The optical density (OD_{600nm}) was measured every 2 hours over the period of 12 hours. Results are represented as the mean of triplicate experiments \pm SD.
