

Supplementary Data

SUPPLEMENTARY FIG. S1. Measures of insulin resistance based on fasting plasma triglycerides. Triglycerides were categorized as <50, 50–150, and >150 mg/dL. **(A)** The mean SD of HOMA-IR was significantly different between the three groups. **(B)** The mean SD of triglyceride index was significantly different between the three groups. $p < .05$, one-way ANOVA. ANOVA, analysis of variance; HOMA-IR, homeostatic model assessment-insulin resistance; SD, standard deviation.
