

Supplementary materials for MS “Pollen grain size associated with pollinator feeding strategy ” by Kai HAO et al.

Figure S1 to S4; Table S1 to S3

Figure S1.

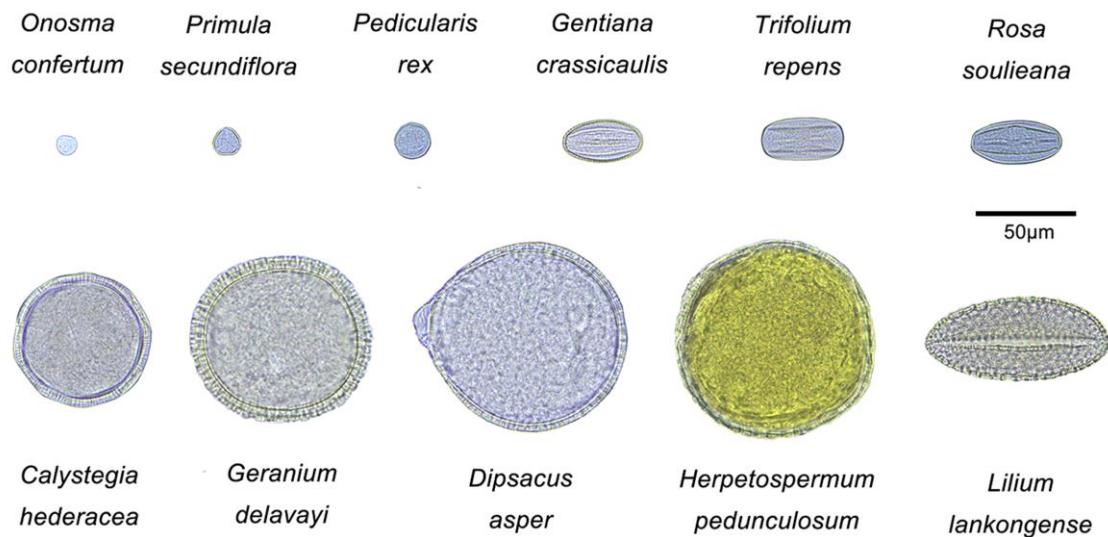

Fig. S1. Pollen samples of 11 species from Shangri-La, southwest China under a light microscope, showing pollen grain size ranging from small (upper six species) to large (bottom five species). Scale bar = 50 μm .

Figure S2

Fig. S2. Bumblebees (upper line) or solitary bees (bottom line) positively collecting pollen into corbiculae or scopae on the hind legs (arrows), leaving less pollen for fertilization. *Bombus festivus* collecting pollen from *Pedicularis cephalantha* (a); *Bombus friseanus* collecting pollen from *Pedicularis siphonantha* (b) and *Astragalus pullus* (c); halictid bee collecting pollen from *Rosa soulieana* (d); *Thalictrum delavayi* (e) and *Potentilla lancinata* (f).

Figure S3

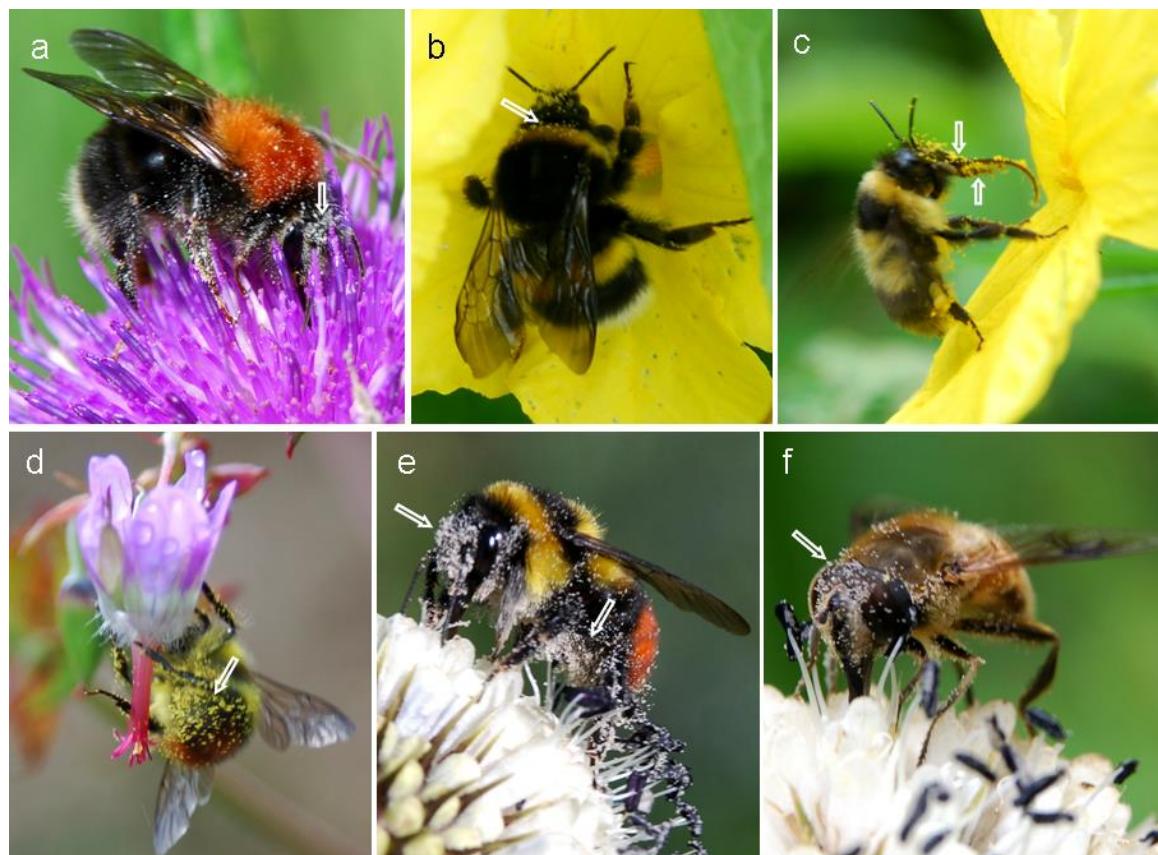

Fig. S3. Pollen grains passively placed on the floral visitors' bodies were not groomed and packed into pollen baskets, and were likely to be delivered to the next flowers visited. These plant species are characterized by relatively large pollen grains, perhaps because relaxed selection by pollen collection permits plants to produce fewer but larger pollen grains. While nectar is sucked from *Cirsium shansense*, the white pollen accumulates passively on the head, ventral surface and legs of *Bombus festivus* (a); *Bombus lucorum* (b) and another bumblebee (c) collecting nectar from male flowers of *Herpetospermum pedunculosum*. Note that the yellow pollen grains are passively placed on the head or tongue; lots of yellow pollen from *Geranium delavayi* passively placed on the bumblebee's abdomen but not groomed (d); both the bumblebee *Bombus friseanus* (e) and a syrphid fly *Eristalis tenax* (f) rejecting white pollen grains from *Dipsacus asper*. Arrows mark passive accumulation of pollen on the pollinator body. Compared to plants shown in Figure S2, no pollen loads are visible on the bumblebees' hind legs when they are visiting plants illustrated here.

Figure S4

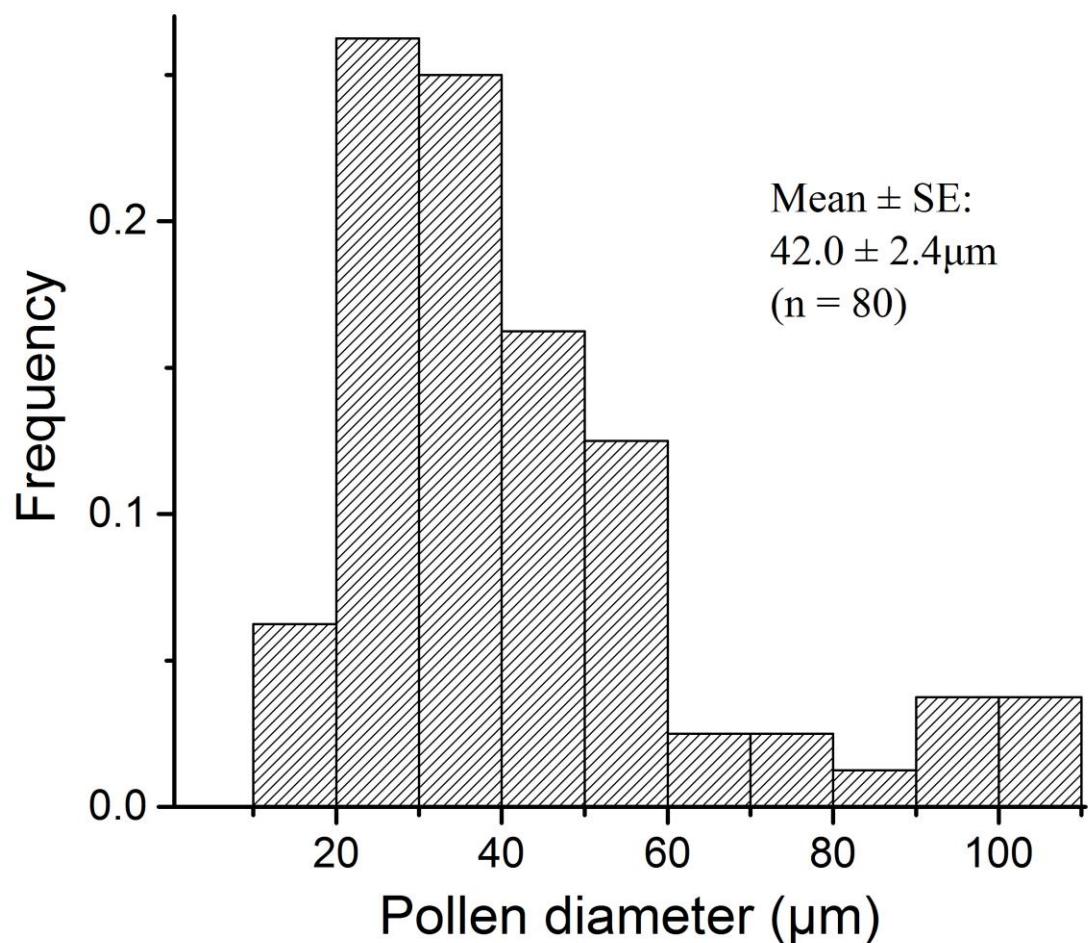

Fig. S4. Variation in pollen diameter in the 80 flowering species from natural communities in Shangri-La field station, southwest China.

Table S1. Three hypotheses proposed for the evolution of pollen grain size and collected evidence of interspecific comparisons of pollen-related traits in the studied plant communities. A null (allometry) hypothesis and two functional hypotheses including pre-pollination pollinator foraging and post-pollination stilar-interaction are considered.

| Hypothesis | Evidence | | |
|---------------------|--|--|---|
| | Correlation between flower size and grain size | Association between pollen foraging and grain size | Correlation between style length and grain size |
| Allometry | Support | Reject | Support |
| Pollinator foraging | Neither reject nor support | Support | Neither reject nor support |
| Stylar interactions | Neither reject nor support | Reject | Support |

Table S2. Dataset of floral traits (mean value) and number of sampled flowers per species, pollen grain diameter and pollen production per flower, pollinator foraging pollen behaviour and observation period in 80 flowering species at Shangri-La field station, southwest China, and DNA sequence code downloaded from the Genebank (NCBI).

Table S3. The results of trait correlations from 21 publications between pollen size and style length or stigma depth, and/or flower size, or pollen number. The phylogenetic independent contrast (PIC) analysis and measurement of flower size were involved only in a few lineages.

Table S2. Dataset of floral traits (mean value) and number of sampled flowers per species, pollen grain diameter and pollen production per flower, pollinator foraging pollen behaviour and observation period in 80 flowering species at Shangri-La field station, southwest China, and DNA sequence code downloaded from the Genebank (NCBI).

| Family | Taxon | Substituted taxon (if the origin taxon was not found in Genebank) | Surface area of corolla (mm ²) | Sample size (herbarium specimen) | Style length (mm) | Sampled flowers (n) | Pollen size (um) | Sampled flowers (n) | Pollen number | Sampled flowers (n) | Pollen exposure | Grooming pollen behaviour | Main pollinator | Total observation time | Observation period | ITS | mat K | rbc L |

Outgroup

Magnoliaceae *Tasmannia lanceolata*

AY004128 AF543735 AY298851

Table S3. The results of trait correlations from 22 publications between pollen size and style length or stigma depth, and/or flower size, or pollen number. The phylogenetic independent contrast (PIC) analysis and measurement of flower size were involved only in a few lineages.

| Authors | Year | Family or taxon | PIC analysis in pollen size | Style length | Flower size | Stigma depth | Pollen number |
|----------------------|------|---|--------------------------------|----------------------------|----------------|----------------------|------------------|
