

# THE LANCET

## Supplementary appendix

This appendix formed part of the original submission and has been peer reviewed.  
We post it as supplied by the authors.

Supplement to: Global Burden of Disease Health Financing Collaborator Network.  
Health sector spending and spending on HIV/AIDS, tuberculosis, and malaria,  
and development assistance for health: progress towards Sustainable Development  
Goal 3. *Lancet* 2020; published online April 23. [http://dx.doi.org/10.1016/  
S0140-6736\(20\)30608-5](http://dx.doi.org/10.1016/S0140-6736(20)30608-5).

SUPPLEMENTARY METHODS ANNEX

Health spending for Sustainable Development Goal 3: total, HIV/AIDS, tuberculosis, malaria, universal health service coverage, financial risk protection, and donor spending, 2000 to 2030 and 2050

Version: March 26, 2020

Global Burden of Disease Health Financing Collaborator Network

## Table of Contents

### SECTION 1. METHODS OVERVIEW

S1.1 Overview

S1.2 Estimating domestic health spending: 1995-2016

S1.3 Estimating development assistance for health: 1990-2018

S1.4 Reporting and uncertainty analysis

### SECTION 2. TRACKING TOTAL HEALTH SPENDING AND ITS COMPONENTS

S2.1 Overview

S2.2 Statistical model to fill missingness in health expenditure variables

S2.3 Currency exchange and deflation

### SECTION 3. TRACKING DEVELOPMENT ASSISTANCE FOR HEALTH FROM TRADITIONAL DONORS

S3.1 Overview

S3.2 Tracking development assistance for health from bilateral aid agencies and the European Commission

S3.3 Tracking development assistance for health from the development banks

S3.4 Tracking contributions from GFATM and GAVI

S3.5 Tracking expenditure by United Nations Agencies active in the health domain

S3.6 Tracking development assistance for health from private foundations

S3.7 Tracking non-governmental organizations

S3.8 Tracking Development Assistance for health from China

S3.9 Calculating the technical assistance and program support component of development assistance for health from loan-and grant-making channels of assistance

S3.10 References

### SECTION 4. TRACKING TOTAL SPENDING ON MALARIA BY SOURCE IN 106 COUNTRIES, 2000–2017

S4.1 Currency conversion

S4.2 Spatiotemporal Gaussian process regression (ST-GPR)

S4.3 Government health expenditure as a source on malaria

S4.3.1 Data

S4.3.2 Modeling government expenditure on malaria patient care

- S4.3.3 Modeling total government expenditure on malaria
- S4.4 Out-of-pocket expenditure on malaria
  - S4.4.1 Price-volume model
  - S4.4.2 Modeling total out-of-pocket expenditure on malaria
  - S4.4.3 Excluding data from an NHA from Nigeria
- S4.5 Prepaid private expenditure on malaria
- S4.6 Malaria elimination status of the 106 countries
- S4.7 Data density
- S4.8 References

## SECTION 5. TRACKING TOTAL SPENDING ON HIV/AIDS BY SOURCE IN 135 LOW- AND MIDDLE-INCOME COUNTRIES, 2000 THROUGH 2017

- S5.1 Acronyms and abbreviations
- S5.2 Overview
- S5.3 Removing non-HIV focused spending from GARPR/GAM datasets
- S5.4 Currency conversion
- S5.5 Modeling HIV/AIDS spending with ST-GPR
- S5.6 Enforcing internal consistency
- S5.7 Development assistance for health
- S5.8 References

## SECTION 6. FORECASTING HEALTH SPENDING FROM 2017 through 2050

- S6.1 Data
  - S6.1.1 Summary of Data Sources
  - S6.1.2 World Health Organization's Global Health Expenditure Database
  - S6.1.3 WB WDI, IMF WEO, PWT, and Maddison
  - S6.1.4 Institute for Health Metrics and Evaluation's Development Assistance for Health Database
  - S6.1.5 Institute for Health Metrics and Evaluation's Global Burden of Disease Study 2017
- S6.2 Covariates
  - S6.2.1 List of Forecasted Variables
  - S6.2.2 Covariates Used for Forecasting

- S6.3 Ensemble Modeling
  - S6.3.1 Sub-model Setup
  - S6.3.2 Covariates
  - S6.3.3 Convergence to Global Growth Rates
  - S6.3.4 Specifications
- S6.4 Inclusion and Exclusion Criteria
- S6.5 Creating the Forecasts
  - S6.5.1 Ranking Sub-Models
  - S6.5.2 Uncertainty Estimation
- S6.6 Ad-hoc Draws Correlation
  - S6.6.1 Motivation
  - S6.6.2 Bivariate Correlated Distributions
- S6.7 Future Health Scenarios
  - S6.7.1 Long-term Growth Regressions
  - S6.7.2 Forecasting Better and Worse Scenarios
  - S6.7.3 Uncertainty Estimation
- S6.8 Package and Architecture
  - S6.8.1 Architecture
  - S6.8.2 Template Model Builder

IDA	International Development Association
IDB	Inter-American Development Bank
LCU	Local currency units
NASA	National AIDS Spending Assessments
NGO	Non-governmental organizations
NHA	National Health Accounts
NPISH	Non-profit institutions serving households
ODA	Official development assistance
OECD	Organisation for Economic Co-operation and Development
OOP	Out-of-pocket health spending (defined in GHED: "Other revenues from households n.e.c")
PAHO	Pan American Regional Office for WHO
PI	Private insurance
PPP	Prepaid private health spending (Aggregate of "Voluntary prepayment", "Other revenues from corporations n.e.c.", "Other revenues from NPISH n.e.c.", and "Compulsory prepayment (Other, and unspecified, than FS.3)", as defined in GHED)

SHA 2011	System of Health Accounts 2011
SWAps	Sector Wide Approaches
TB	Tuberculosis
THE	Total health spending (defined in GHED: “Current health expenditure by revenues of health care financing schemes”)
UNICEF	United Nations Children’s Fund
UNAIDS	Joint United Nations Programme on HIV/AIDS
UNFPA	United Nations Population Fund
USD	US dollars
VolAg	Report of Voluntary Agencies
WHO	World Health Organization

## SECTION 1. METHODS OVERVIEW

### S1.1 Overview

The methods presented here summarize the various components of the estimation process; interested readers are encouraged to consult the appendix for additional details on data sources, methods, and for additional results presented in alternative units. “Health spending” is defined as money spent on services, supplies, and basic infrastructure to deliver health care, using the same definition employed by the System of Health Accounts 2011 and the WHO Global Health Expenditure Database (GHED).<sup>1,2</sup> Health “financing” and “funding” are used interchangeably to refer to the source, as opposed to the utilization, of financial resources. “Economic development” refers to GDP per capita.

We estimated health spending from four main sources – government, out-of-pocket, prepaid private, and DAH – for 195 countries and territories. For brevity, “countries and territories” are referred to only as “countries”, all of which are categorized into four World Bank income groups (high-, upper-middle-, lower-middle-, and low-income) and seven Global Burden of Disease (GBD) super-regions (Central Europe, Eastern Europe, and Central Asia; GBD high income; Latin America and Caribbean; North Africa and Middle East; South Asia; Southeast Asia, East Asia, and Oceania; and sub-Saharan Africa). Data tracking government, out-of-pocket, and prepaid private health spending, which together comprise total domestic health spending, were available from 1995 through 2017. Government health spending includes social health insurance and mandated private health insurance, as well as government public health programmes. Out-of-pocket health spending includes health care spending paid by the patient or his or her household, excluding insurance premiums paid in advance of care. Prepaid private health spending includes voluntary private insurance and non-governmental agency spending on health.

Estimates of DAH, defined as the financial and in-kind contributions from major development agencies to low- and middle-income countries for the purpose of maintaining or improving population health, were generated from 1990 through 2019, although transfers to recipient countries can only be estimated until 2017. In other words, the total amount of DAH, by source, is estimated through 2019, but is not allocated by recipient country for 2018 and 2019. The sum of domestic health spending and DAH, net of the administrative costs needed to run the development agencies, form the envelope of total health spending for each country and year.

Domestic health spending from each of the three sources was projected for each country from 2018 to 2050, and DAH was projected from 2018 to 2050, by modelling rates of change across time. These models incorporate country-specific time trends that attenuate across time and converge to the global average, consider a broad set of covariates and time-series modelling techniques, and propagate four types of uncertainty - model, data, parameter, and fundamental uncertainty.

### S1.2 Estimating domestic health spending: 1995–2017

We extracted data on gross domestic product (GDP) per capita from five leading sources of these estimates (World Bank, International Monetary Fund [IMF], United Nations, Penn World Tables, and Maddison) and built from methods described by James and colleagues to generate a single series of GDP per capita using Gaussian processes.<sup>3-7</sup> This method incorporated data from all five GDP series and also propagated uncertainty through the estimates.<sup>8</sup> The resulting series spans 195 countries from 1950 to 2019, and larger uncertainty intervals highlight countries where the input data from the five sources was discordant or estimates were missing.

We extracted data from the WHO's Global Health Expenditure Database (GHED) on government domestic revenue transfers allocated for health, compulsory prepayment, voluntary prepayment, social insurance contributions, and other domestic revenue from households, corporations, and non-profit institutions serving households.<sup>9</sup> Data from GHED excludes spending on major investments such as hospital construction, health worker education and training, and research and development. Countries report these data and the data source to WHO; when possible, these are based on National Health Accounts, but alternative sources are used in many cases. Health spending estimates were extracted in current national currency units, deflated 2019 national currency units, and exchanged to 2019 US dollars. Deflator series and exchange rates used were based on those reported in the IMF World Economic Outlook.<sup>5</sup>

We estimated domestic government spending on health by aggregating transfers from government domestic revenue for health purposes, compulsory prepayment, and social insurance contributions. Then, to estimate domestic prepaid private health spending, we aggregated voluntary prepayment, other domestic revenues from non-profit institutions serving the household, and other domestic revenues from corporations. All payments by households other than social insurance contributions were designated as out-of-pocket spending. To generate domestic health spending estimates in purchasing-power parity-adjusted (PPP) dollars, we multiplied the health spending fractions by GDP per capita measured in 2019 PPP dollars.

The extracted data were evaluated for quality. Some of the extracted data points were not tied to an underlying data source and were estimated using a diverse set or poorly defined methods. Furthermore, for a given country, some data varied substantially across time. To overcome these concerns, we used a spatiotemporal Gaussian process regression model to estimate health spending across time, country, and spending category.<sup>10</sup> To prevent data with insufficiently described estimation methods or without data source identification from substantially influencing our model estimation, each data point was assessed and assigned a weight between one and five using the point-specific metadata provided in the GHED. We based weights on metadata completeness, documented source information, and documented methods for estimation. The distribution of data points assigned to each of the five data quality scores, by country income group, is presented in the appendix. Our guidelines for assessing the metadata, a detailed description of how the weights were created, and additional information about the spatiotemporal Gaussian process regression model can also be found in the appendix.

### [S1.3 Estimating development assistance for health: 1990–2019](#)

To track DAH, we relied on revenue data in financial statements, annual reports, budget documents, and project disbursement records reported by international development agencies such as the Organisation for Economic Co-operation and Development (OECD) Creditor Reporting System, the World Bank, the Global Fund, and major philanthropic entities like the Bill & Melinda Gates Foundation, Susan Thompson Buffet Foundation, and Rotary International.<sup>11–20</sup> We used budget and commitment data to generate estimates for recent years for which disbursement data were not yet available; for most channels data extends to 2017 or 2018 so that at most two years of estimation were needed.

Our DAH estimates tracked disbursements from the originating donor (called the source); to the development agency responsible for disbursing the funds to the recipient country (called the channel); to the recipient country. We used revenue and disbursement data to count only once the transfers between development agencies to limit double counting. In addition to reporting the source, channel, and recipient of DAH, spending was disaggregated into nine major health focus areas (as well as more detailed programme areas) by searching project titles and descriptions for keywords, as well as using other indicators in the data. Health focus areas included HIV/AIDS; malaria; tuberculosis; reproductive and maternal health; newborn and child health; non-communicable diseases; other infectious diseases; sector-wide approaches

and health system strengthening; and other. The “Other” category captured projects such as general support for a conference on the Sustainable Development Goals that were not allocated to any of the eight specific health focus areas; remaining funds for which no project descriptions were available were classified as “unallocable.” The list of keywords used to isolate relevant health projects for each of the health focus areas are included in the supplemental appendix Table S3.4.

While the majority of the methods used for tracking DAH have been described previously, the current estimates of DAH incorporated improvements in methodology such as leveraging additional project level descriptions from the Creditor Reporting System for the allocation of disbursements channeled through NGOs and ongoing refinement of our keyword search list.<sup>21-25</sup> For all DAH tracking, we include on funds that were transferred through major development agencies included in our research, as well as private foundation and non-governmental agencies for whom we have data. This definition of DAH excludes spending on basic bench science which may have down-stream effects on the development of new drugs.

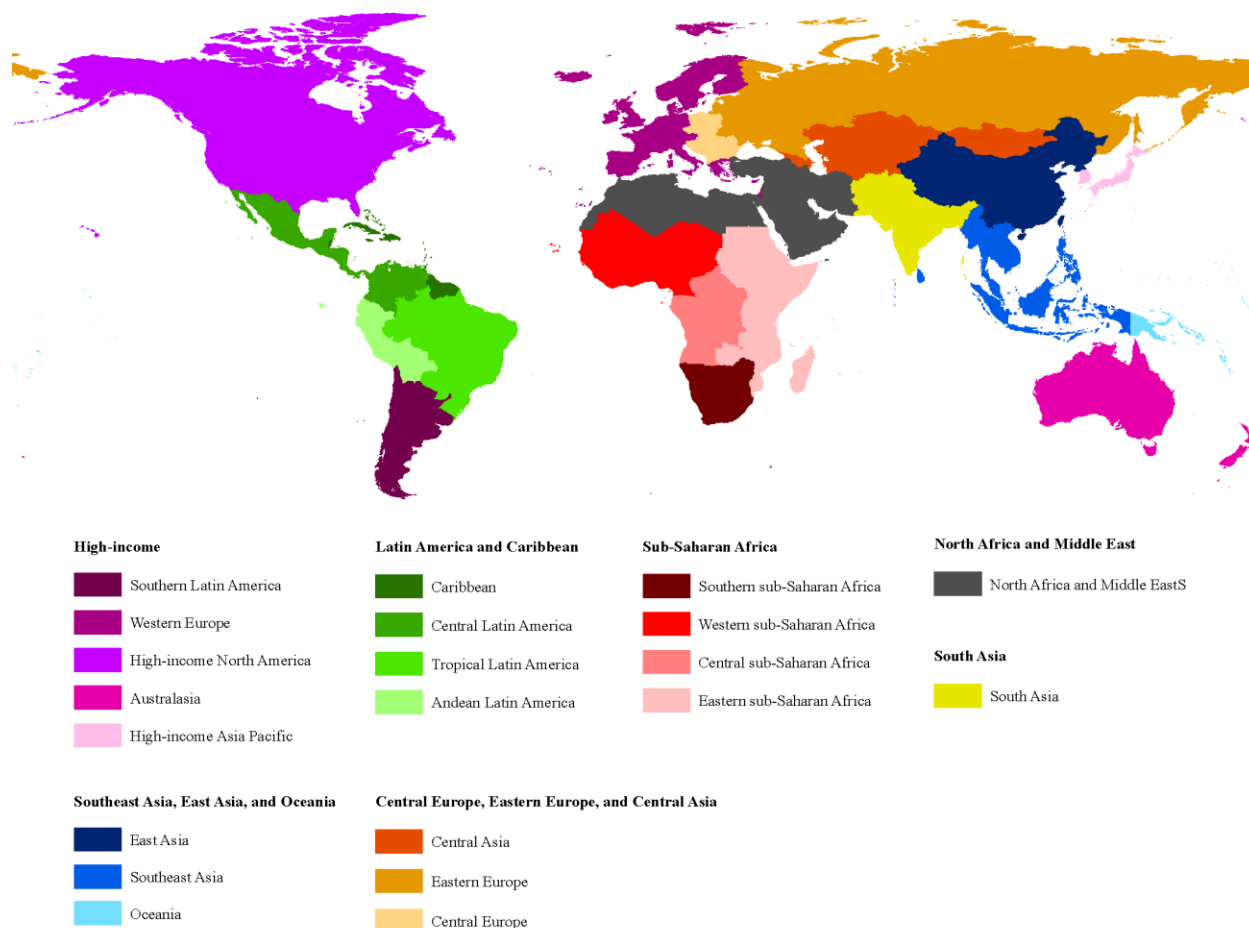

#### S1.4 Reporting and uncertainty analysis

All inflation-adjusted health spending estimates are reported using 2019 prices. Future values are not discounted. We report health spending per capita in US dollars and purchasing-power parity-adjusted dollars and as a fraction of GDP. When not otherwise indicated, estimates are reported in 2019 US dollars. We report country spending estimates using 2019 Global Burden of Disease super-regions and 2019 World Bank income groups, regardless of whether a country changed, or is projected to change, income groups during the study period.<sup>28,29</sup> GBD regions can be seen in Figure S1.4 below. Rates were calculated to reflect each group, rather than the average of countries within the group, such that spending per capita estimates for an income group or region more heavily reflect rates in more populous countries. The uncertainty interval around each estimate was computed using the 2.5th and 97.5th percentiles of the 1,000 draws. All analyses were done using R (version 3.6.0), Stata (version 15.1), and Python (version 3.6). Table S1.4 presents all packages used for the analyses in this paper.

**Table S1.4 Programming packages used for analyses**

## SECTION 2. TRACKING TOTAL HEALTH SPENDING AND ITS COMPONENTS

### List of Tables and Figures

Table S2.1 Rules for assigning weight values to metadata

Table S2.2 Countries and income groups, number of assigned weights

Figure S2.1 Comparison of WHO GHED extracted and IHME ST-GPR THE in per capita space, 2000-2017

Figure S2.2 Comparison of WHO GHED extracted and IHME ST-GPR THE in per GDP space, 2000-2017

Figure S2.3 Currency conversion process diagram

### S 2.1 Overview of GHED data cleaning process

We used Global Health Expenditure Database (GHED) data from the World Health Organization (WHO) to generate our estimates.<sup>1</sup> From the GHED, we extracted "Current health expenditure by revenues of health care financing schemes" for total health expenditure (THE), "Other revenues from households n.e.c" for out-of-pocket (OOP), "Gross Domestic Product" for GDP. We summed "Social insurance contributions" and "Transfers from government domestic revenue (allocated to health purposes)" for government health spending (GHE). We summed "Voluntary prepayment", "Other revenues from corporations n.e.c.", "Compulsory prepayment (Other, and unspecified, than FS.3)", and "Other revenues from NPISH n.e.c." for pre-paid private (PPP).

To ensure we used the best possible data from the GHED, we evaluated the metadata also provided by GHED to establish the reliability of the data. To do so, we downloaded the metadata from the GHED website for each data point for the five indicators. We used the metadata to decide how each given data point should be weighted, from 0 to 5, with 0 meaning drop, and 1 through 5 meaning keep and treated these weights as inverse variance weights.

To assign the weights, we established guidelines for the metadata that informed how the underlying data points should be weighted. We gave priority to factors such as complete, documented source information and penalized factors such as having been derived or estimated. Table S2.1 below describes the guidelines we created; any metadata that did not meet any of the disqualifying factors were given a value of 5 to reflect highest reliability.

We used the four primary metadata variables from the GHED database: data type, method of estimation, comments, and sources. We applied the guidelines to each unique set of metadata across these four variables. For a subset of data points, the metadata indicated that the data point was the sum of other data points. In these cases, if the indicator was a sub-indicator of GHES, PPP, or OOP, we assigned the data point a value of 2 to reflect that even though we could not determine if the sub-components existed, as they are not reported in GHED, we did not feel that being a sum warranted dropping the data. We assigned the summed GHES, PPP, and OOP indicators the lowest value of its sub-indicators. If the summed data point was THE, however, we assigned the data point the lowest value of its sub-components, the summed GHES, PPP, and OOP indicators.

After designating each of the 3,730 unique sets of metadata a value weight, we applied these weights to the underlying data points. In total, we had 30,590 data points, as multiple data points shared the same unique set of metadata. Once the weights were applied to the data, we reassigned all high-income country data points that were a 0 based on the metadata to 3. We made this change to reflect that high-income countries have higher quality data and thus should not be dropped, but should also not be given the

highest weight value. The high-income classification comes from the World Bank.<sup>2</sup> For all countries across all years of data their relative weighting scores can be seen in Table S2.2.

Each component of health expenditure was aggregated for all component-year-country combinations by taking component values (downloaded in current national unit); dividing by GHED reported GDP for the corresponding year-country (also in current national unit) to convert each component into its fraction of GDP; and finally multiplying those fractions by IHME GDP series measured in USD 2019. (Note: though we harvested and cleaned metadata for THE and GDP, we do not model THE (we model GHE, PPP, OOP and then aggregate) or use the WHO’s GDP data since we have our own methods with multiple sources for determination of our value).

Each component of health expenditure was then converted into three spending metrics for the time period between 2000-2017, measured in purchasing power parity (PPP): health spending per capita (\$), annualized rate of change in health spending per capita 2000-2017 (%), and annualized rate of change in health spending 2000-2017 (%). Then, each component of health expenditure was aggregated and converted into six spending metrics for the time period between 2018-2050, measured in PPP: health spending per capita (\$), annualized rate of change in health spending per capita 2018-2050 (%), annualized rate of change in health spending 2018-2050 (%), Government health spending per capita (\$), difference between GHEpc (government health expenditure per capita) reference scenario and better scenario 1, 2050 (\$), and difference between GHEpc reference scenario and better scenario 2, 2050 (\$).

**Formula for calculating AROC (Annualized rate of change):**

If you apply this growth rate n times (where n is the number of steps from starting to ending year) to the value in the starting year, you will get the value in the ending year. For example –

$$AROC_{1990 \rightarrow 2019} = \left( \frac{\text{value in 2019}}{\text{value in 1990}} \right)^{\frac{1}{2019-1990}} - 1$$

**Table S2.1 Rules for assigning weight values to metadata**

Data type	Methods of estimation	Sources and/or Comments	Weight
Blank			0
Estimated			0
	Derived by applying the sum of the components		Lowest weight of the components
	Interpolated but with additional information		2
	Method description is unclear or provides very little information		0
	Time trend interpolation		1
	Uses data from other countries		0

Data type	Methods of estimation	Sources and/or Comments	Weight
		Abstract that's not from something documented	1 or method (whichever is bigger)
		Adjusted	0 or method (whichever is bigger)
		Adjusted using something	2 or method (whichever is bigger)
		Any suggestion that the WHO is unclear or unsure about some aspect of the data point's metadata	0 or method (whichever is bigger)
		Approximation	0 or method (whichever is bigger)
		Assumption	0 or method (whichever is bigger)
		Both blank	0 or method (whichever is bigger)
		Both with no intelligible information	0 or method (whichever is bigger)
		Budget address	1 or method (whichever is smaller)
		Calculation was used to generate the estimate	1 or method (whichever is bigger)
		Consultation/contact (without an additional documented source)	1 or method (whichever is smaller)
		Consultations with additional source, but no specifics and just consult is documented	1 or method (whichever is bigger)
		Currency conversion	1 or method (whichever is bigger)
		Data delivered/provided/reported by (a non-documented source)	1 or method (whichever is smaller)
		Data provided but not clear by whom, with an additional source if additional source is not documented	1 or method (whichever is smaller)
		Derived	0 or method (whichever is bigger)
		Estimated based on	1 or method (whichever is bigger)
		Estimation	0 or method (whichever is bigger)
		Excludes (if it excludes what we do want)	0 (supersedes method)
		Extrapolated	0 or method (whichever is bigger)
		Forecasted	0 or method (whichever is bigger)
		Government department, no explicit documented source	1 or method (whichever is bigger)
		Government ministry, but no explicit documented source	1 or method (whichever is bigger)
		Includes (if it includes what we don't want)	0 (supersedes method)
		Inferred	0 or method (whichever is bigger)
		Interpolation	0 or method (whichever is bigger)
		Missing (if missing something that should be included)	0 (supersedes method)
		Modified	0 or method (whichever is bigger)

Data type	Methods of estimation	Sources and/or Comments	Weight
		Modified from something/modified using something	2 or method (whichever is bigger)
		Needs assessment	1 or method (whichever is smaller)
		Needs discussion	1 or method (whichever is smaller)
		Needs validation	1 or method (whichever is smaller)
		Needs verification	1 or method (whichever is smaller)
		Only provides hint of a source	1 or method (whichever is smaller)
		Projected	0 or method (whichever is bigger)
		Provides only a vague term that does not provide adequate information to infer or determine what the source is	0 or method (whichever is bigger)
		Reply	1 or method (whichever is smaller)
		Response	1 or method (whichever is smaller)
		Speech	1 or method (whichever is smaller)
		Sum of	2 (except for THE, which is lowest weight of components)
		Total of	3 (except for THE, which is lowest weight of components)
		Underestimated	0 (supersedes method)
		Unpublished	1 or method (whichever is smaller)
		Validated figures, but without specifics	2 or method (whichever is bigger)
		Weights	0 or method (whichever is bigger)

## S2.2 Statistical model to fill missingness in health expenditure variables

After the cleaning up of the data previously described above, we used Spatiotemporal Gaussian process regression (ST-GPR) in order to predict and fill out the missingness that existed in the resulting health expenditure dataset. ST-GPR is a stochastic modeling technique designed to detect signals amidst noisy data. It also serves as a powerful tool for interpolating non-linear trends. Unlike classical linear models that assume that the trend underlying data follows a definitive functional form, GPR assumes that the specific trend of interest follows a Gaussian process, where each point can be estimated with a mean and covariance function.

The first step to implementing ST-GPR is to identify relevant covariates that would be helpful in predicting each health expenditure variable of interest. Using the following set of covariates, we estimated the first stage of the process (space-time) in order to predict and fill up the dependent variables. The covariates used are:

- a) All-sector government expenditure per capita, logged
- b) Lag Distributed Income, logged
- c) Healthcare Access and Quality Index, logged
- d) Proportion of total population above the age of 65, logit transformed.

The dependent variables were logs of GHE per capita, PPP per capita and OOP per capita. We also run these models sequentially so that the following model can include the previous component as a covariate. GHE per capita uses only the above covariates, while PPP per capita additionally included GHE per capita as a covariate, and OOP per capita additionally uses GHE per capita and OOP per capita as covariates.

Given the weight of data, we were able to adjust the weight of each data point that contributed to the likelihood function of the Gaussian process, by inflating the pointwise variance for data points with lower weights. For missing data points, the resulting uncertainty was determined by region specific estimates. The final resulting dataset was a complete set of GHE, PPP and OOP per capita estimates for 195 countries from 1995 through 2017, where the uncertainty around each point was constructed by simulating from a normal distribution. Goodness-of-fit was determined using out-of-sample validation and choosing the models with the best performing set of hyperparameters. Overall, ST-GPR is a stochastic modeling technique that performs well at detecting signals among datasets that are noisy. It deviates from classic linear models that assume trend of its underlying data must follow a definitive functional form. Instead, GPR assumes the trend must follow a Gaussian Process form, having a covariance function and a pointwise mean. For the distribution of the Gaussian process, we used a Matérn covariance matrix. GPRs were run repeatedly to ensure that every country-year estimate per metric had 1,000 draws. This ST-GPR process follows the same form of that found in the Global Burden of Disease Study 2017 appendix.<sup>3</sup> This analysis was conducted in the following programs: Stata (version 13.1) and R (version 3.6.0).

Figure S2.1 below shows the comparison of WHO GHED extracted data and IHME ST-GPR THE in GDP per capita space from 2000-2017. Figure S2.2 shows the comparison of WHO GHED extracted data and IHME ST-GPR THE in per GDP space from 2000-2017.

Figure S2.1 Comparison of WHO GHED extracted and IHME ST-GPR THE *in per capita* space, 2000-2017

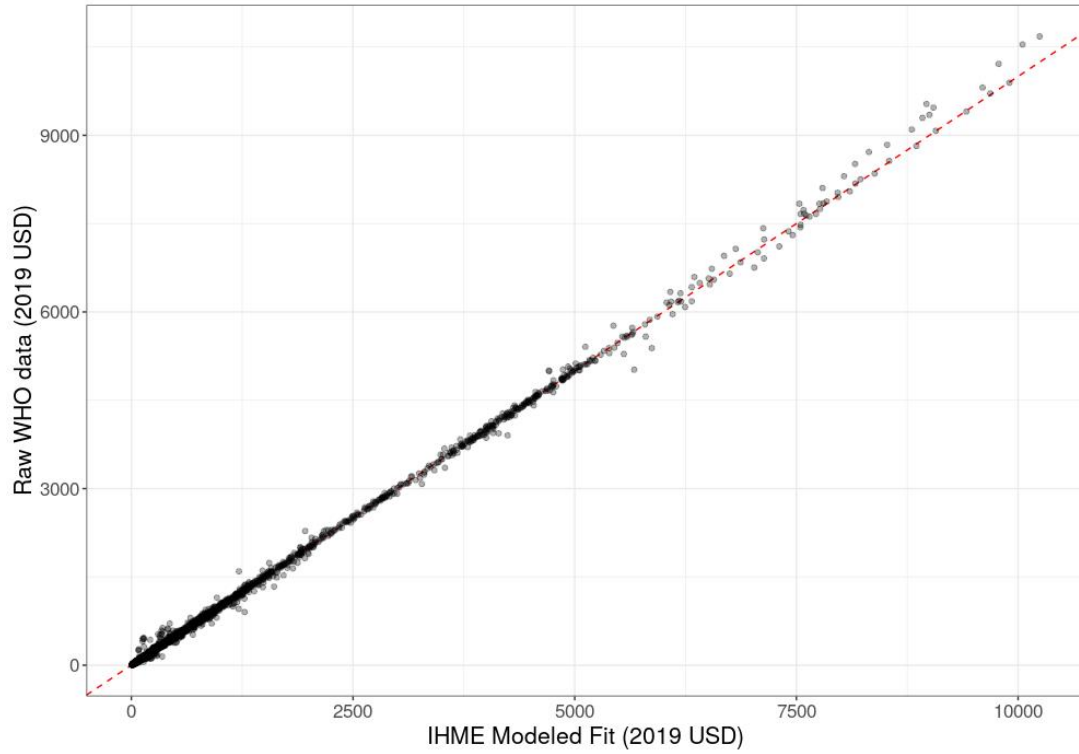

Figure S2.2 Comparison of WHO GHED extracted and IHME ST-GPR THE *in per GDP* space, 2000-2017

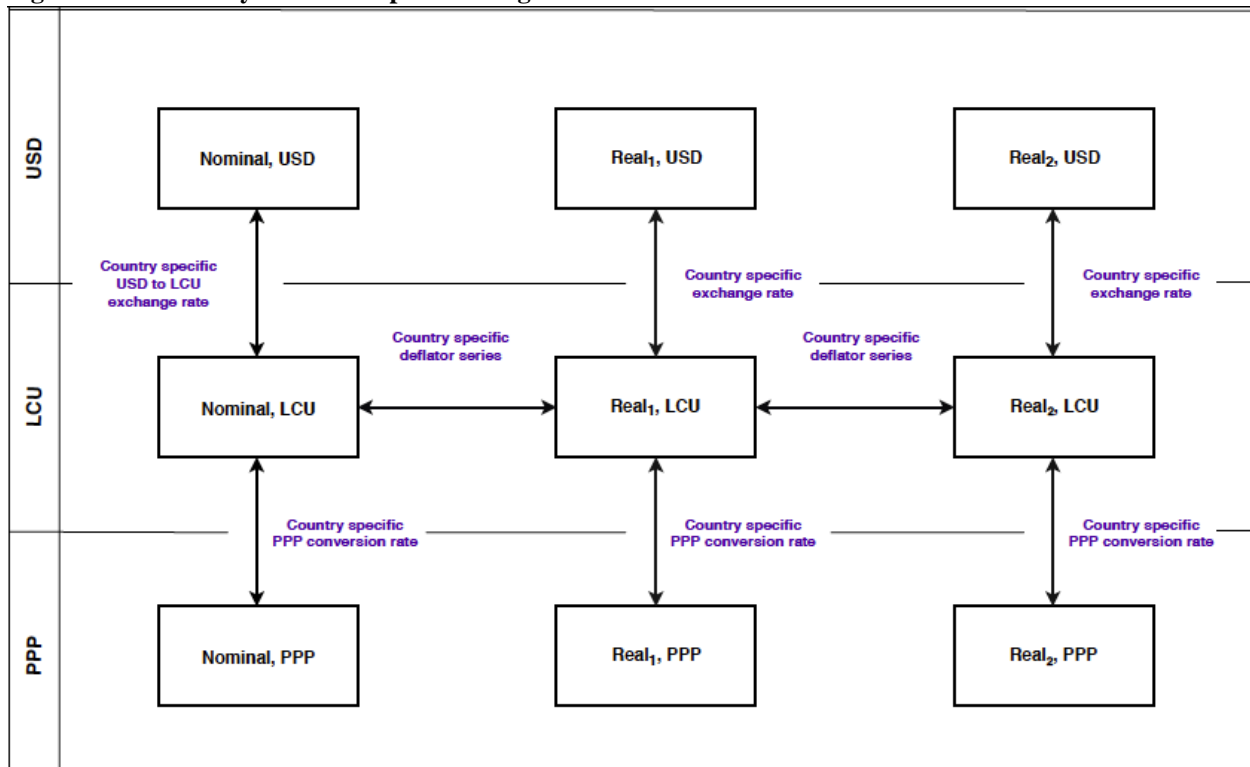

### S2.3 Currency exchange and deflation

To convert a metric from real 2019 USD to real 2019 PPP, the following steps were taken. Real USD was exchanged to real LCU (local currency units) by multiplying with country-year specific USD to LCU exchange rates. Then, values were converted from real LCU to real PPP (purchasing-power parity-adjusted dollars) using the country-year specific LCU to PPP conversion series. Any currency deflation from nominal to real currency units or between real currency units in different base years were performed after converting either USD or PPP to LCU, and used country-specific deflator series. All deflators and exchange rates were extracted from the World Bank<sup>4</sup>, International Monetary Fund<sup>5</sup>, Penn World Tables<sup>6</sup>, the United Nations National Accounts<sup>7</sup>, and the World Health Organization<sup>8</sup>, and were imputed to provide a complete series for each of the variables between 1950 and 2019. We then used several models including ordinary least-squares regression and mixed effects models, to complete each source series from 1950 to 2019.

Figure S2.3 shows the currency conversion process used in this work.

**Figure S2.3 Currency conversion process diagram**

### S3.1 Overview

We summarize the original methodology as well as updates for this year's estimates below. A more detailed description of the original methodology used to obtain the estimates can be found in Dieleman et al.<sup>1</sup> All known, systematically reported, available data on health-related disbursements and expenditures were extracted, as well as income and revenue from existing project databases, annual reports, and audited financial statements. The channels included and the corresponding data sources are summarized in Table S3.1. Data sources obtained via personal correspondence are summarized in Table S3.2.

DAH for bilateral agencies included all health-related disbursements from bilateral donor agencies, excluding funds that they transferred to any of the other channels we tracked in order to avoid double-counting. This information was extracted from the Creditor Reporting System (CRS) and Development Assistance Committee (DAC) databases of the Development Assistance Committee of the Organisation for Economic Co-operation and Development (OECD-DAC). In some cases, donor agencies did not report disbursement data to the CRS. A method for predicting disbursements from commitment data was implemented to address this challenge. For detailed description of this method see Tracking Development Assistance for Health from Bilateral Aid Agencies and the European Commission section below as well as in Dieleman et al.<sup>1</sup>

For other grant- and loan-making institutions, annual disbursements on health grants and loans were similarly included, excluding transfers to any other channels and ignoring any repayments on outstanding debts. For a more detailed description of this process see Dieleman et al.<sup>1</sup> The annual disbursements for grant- and loan-making institutions only reflect the financial transfers made by these agencies. Therefore, in-kind transfers from these institutions in the form of staff time for providing technical assistance and the costs of managing programs were estimated separately.<sup>1</sup>

Estimates of DAH for the United Nations (UN) agencies included annual expenditures on health both from their core budgets and from voluntary contributions. Calculating DAH for the United Nations Children's Fund (UNICEF) involved estimating the fraction of its total expenditure spent on health prior to 2001.<sup>1</sup>

Non-governmental organizations' (NGOs) DAH estimates utilized data from US government sources, GuideStar Research Fundamental Plus dataset and a survey of health expenditure for a sample of NGOs to estimate DAH from US-based and internationally based NGOs receiving support from the US government. We were unable to include other NGOs due to the lack of audited and comparable data.

The database also included an analysis of the composition of health funding by recipient country, health focus area and program area. In this round of updates to the database we incorporated improvements in methodology such as leveraging additional project level descriptions from the Creditor Reporting System for the allocation of disbursements channeled through NGOs and ongoing refinement of our keyword search list. All methodological updates made are detailed in their relevant channel sub-section below. The improvements to our health focus area keyword search terms are detailed in Table S3.4.

For many channels, reporting-time lags prevent primary disbursement data for the most recent year(s). For those years, the values of DAH were predicted, using channel-specific time trends. The methods employed to obtain these predictions are summarized in Table S3.3. In general, these methods depend on data availability. The estimates are based on channel-specific budget, commitment, and appropriations data, and in many cases assume the most recent disbursement patterns persist. Due to the lack of more detailed disaggregated data, estimates for the most recent year are not provided for recipient countries.

We predicted ebola funding in 2018-2019 for bilateral sources and the European Commission by assuming that 2018 and 2019 ebola funding was equal to 2017 ebola funding.

In addition, for SWAp/HSS funding, we allocated SWAP/HSS projects with multiple health focus areas identified by a proportional allocation based on the relative proportions of the project going to the various health focus areas.

For countries that only began existing in certain years, we backcasted DAH in years before their existence as follows. For countries that split off from parent countries, we calculated a three-year average ratio of child country DAH received to parent country DAH received. In years before the child country split off, DAH received by the parent country would have included DAH received in the region that would split off to become the child country. Therefore, we reallocated funding from the parent country, in all years before the child country split off, adding this proportion of the parent country's DAH to the child country's DAH and subtracting out this value from the parent country's DAH. By this method, total annual DAH between the parent and child country do not change, but the allocation of funding between the parent country and child country change. For any country that ceased to exist (such as former Yugoslavia and former USSR) and that had observed DAH received in certain years, we split the funding equally among its new constituent countries.

### S3.1.1 Currency exchange and deflation

All results are presented in real 2019 US dollars. All disbursement sequences were converted into real 2019 US dollars by taking disbursements in nominal US dollars in the year of disbursement and adjusting these sequences into real 2019 US dollars using US gross domestic product (GDP) deflators<sup>99</sup>. Analyses were conducted in Stata (versions 13.1 or 15.1).

\* Years of budget data used for modeling versus years underlying DAH data unavailable thus modeled: The data used to estimate DAH by channel vary across channels. Table S3.1 reports our primary data used for each channel. Due to reporting lags there are some years we need to estimate disbursement using additional data sources. These additional data sources, the years in which the primary data is modeled, the years the additional data is available, and the methods for this estimating these modeled years are reported in Table S3.3. Years of budget data used for modeling are the years of additional data available to us. We rely on historic trends to inform our estimates so we rely on many years of additional data despite only modeling a few years of primary data. Years underlying DAH data unavailable thus modeled are the years the primary data is incomplete and thus estimated using additional data. See example below for more details for Australia.

### **Box 3.1. EXAMPLE - Australia's primary and additional data sources**

**Project-level data for health-related projects funded by Australia's bilateral aid agencies are available from the OECD's CRS database through 2017. This is the primary data source used to estimate DAH channeled by Australian aid agencies, as described in Table S3.1. 2018 and 2019 are incomplete because of lags in reporting. To estimate DAH disbursed for 2018-2019, additional data are available from Australia's International Development Assistance budget (2008-2019) and Australia's Overseas Aid Program budget (1998-2008), as described in Table S3.3. These sources provide health-specific official development assistance (ODA) budgeted by Australia, 1998-2019. We convert countries' budgeted ODA, as given in nominal local currency units, to nominal US dollars using the OECD's currency exchange rate series based on USD monthly averages. To estimate DAH disbursed in 2018-2019, we calculated the ratio of disbursed DAH (from the CRS database) relative to budgeted DAH (from the International Development Assistance and Overseas Aid Program budgets) for 1998-2017. We combine the most recent three ratios into a single estimate by taking a weighted average, weighting substantially higher the most recent year. We multiply this ratio – the estimated disbursed DAH to budgeted DAH – by the 2018 or 2019 budgeted DAH to estimate disbursed DAH in those years. These methods are described more fully in Dieleman et al.<sup>1</sup>**

### S3.1.2 DISAGGREGATING BY HEALTH FOCUS AREA

Similar to our previous work, the analysis of health focus areas included assessments of development assistance for HIV/AIDS, tuberculosis (TB), malaria, reproductive and maternal health, newborn and child health, other infectious diseases, non-communicable diseases, and SWAps and health system strengthening by using keyword searches within descriptive fields. These were chosen as the areas of focus because of their relevance to current policy debates about global health financing and data availability.

In effect, DAH was disaggregated into nine health focus areas: HIV/AIDS, tuberculosis, malaria, reproductive and maternal health, newborn and child health, non-communicable diseases, SWAps/health sector support, other infectious diseases, and other. For most data sources, project-level data were available only through 2018. Methods to estimate health focus area allocations for 2019 are described in more detail below. Keyword searches were performed for a subset of global health channels that provide project-level data with project titles or descriptions. These sources include the bilateral development assistance agencies from 24 DAC member countries, one DAC participant country, GFATM, the World Bank, Asian Development Bank, African Development Bank, Inter-American Development Bank, Bill & Melinda Gates Foundations, Non-government Organizations, US foundations, Wellcome Trust and the European Economic Area. The keywords used are outlined in Table S3.4 below. Descriptive fields were adjusted so that they were all in capitalized letters, special characters were modified, and search terms with multiple words were put between quotation marks. All keywords were translated into nine major languages (English, Spanish, French, Portuguese, Italian, Dutch, German, Norwegian, and Swedish) used in the OECD CRS, checked for double meanings across all languages, and adjusted accordingly.

Total DAH was split across the health focus areas using weighted averages based on the number of keywords present in each project's descriptive variables. If, for example, three keywords suggested the project focused on HIV/AIDS and two keywords related to tuberculosis were also tagged, three-fifths of the project's total DAH was allocated to HIV/AIDS and two-fifths was allocated to tuberculosis. To account for the sensitivity of this method, several checks were implemented after the keyword searches to ensure the project was accurately categorized. First, projects that were tagged as child and newborn vaccines and other infectious diseases were categorized as child and newborn vaccines only. Second, projects that were tagged as one of the three major infectious diseases (HIV/AIDS, tuberculosis, or malaria) and other infectious diseases were categorized under only HIV/AIDS, tuberculosis, or malaria.

#### **Box 3.2. EXAMPLE. Post-keyword search weighting**

**A project in the CRS database had a value of \$1,000 of DAH. A keyword search conducted on this project's title and description tagged five keywords: 3 keywords related to HIV/AIDS and 2 keywords related to tuberculosis. Therefore, \$600, or 3/5 of total DAH, was allocated to HIV/AIDS, while \$400, or 2/5 of total DAH, was allocated to tuberculosis.**

In addition to keyword searches, funds were allocated to health focus areas based on characteristics of the channel or additional channel variables. For the bilateral agencies and the EC, purpose codes from the CRS were used to supplement keyword searches. For the World Bank-IDA and -IBRD, health focus areas were also determined by the project sector codes and theme codes, which included percentages of health funds that targeted each theme. All funds from Gavi were allocated to child and newborn vaccines, health system strengthening and non-communicable diseases and all funds from UNICEF to HIV/AIDS prevention, newborn and child health, ebola, and reproductive and maternal health – other (plus a very small amount being unallocable). Funds from GFATM were distributed to malaria, HIV/AIDS, TB, and health sector support based on disease components. Within each disease component, keyword searches on programmatic budget data and project descriptions were conducted to distribute among program areas. Funds from UNAIDS were allocated to HIV/AIDS and TB with specific program areas determined by budget information. UNITAID funds were allocated based on assignments made by correspondence. UNFPA funds were allocated to specific health focus areas based on project expenditure data from its financial review report. PAHO and WHO funds were allocated to specific health focus areas based on project expenditure data from

correspondence budget data and their proposed programme budgets. For all channels, projects listed as HIV/TB were distributed evenly among the two health focus categories. See Table S3.5 below for more details on these categorizations.

**S3.1.3 Disaggregating preliminary estimates by health focus area**

Estimates by health focus area for years in which descriptive data were not available (usually 2019) were obtained by modeling channel-specific DAH per health focus area as a function of time. Out-of-sample validation was used to test the predictive accuracy of a large suite of models, estimating the models using 1990-2010 data and predicting 2011 and 2012. The potential models included fractional multinomial logit regression, OLS regression, autoregressive integrated moving average (ARIMA) models, Epanechnikov kernel-weighted local polynomial smoothing, and multivariable fractional polynomial models. For each model, time was modeled linearly, with splines, and by including lag-dependent variables. Other methodologies considered included modeling health-focus-area-specific DAH as a dollar amount and as a fraction of the channel-specific total DAH. Lastly, models that involved transforming the dependent variable in natural log and logit transformed space were considered. In order to accommodate zero values in the logit transformation, the transformation described in Smithson and Verkuilen were applied.<sup>73</sup> Over 40 models and specifications were evaluated in total.

Each of the potential model and specification described above were estimated using data from 1990 through 2010, and then the estimated model was used to predict DAH by health focus area for 2011 and 2012. Since we have DAH estimates for 2011 and 2012, we compared the modeled estimates and the observed estimates and calculated average percent deviation and average total absolute deviation for each model and specification across all the channels and health focus areas. A variant of the Epanechnikov kernel-weighted local polynomial smoothing had the smallest average percent deviations and average total absolute error. In this model and specification, health focus area-specific DAH fractions were independently estimated at the channel level after they were logit transformed. Time was the only independent variable included in the model. The health focus area-specific DAH estimates were adjusted so the sum of the channel’s health focus area disbursements totaled channel-specific DAH envelope. Our preferred model, the Epanechnikov kernel-weighted local polynomial smoothing, minimized both the average percent deviation and the total absolute error out of sample, predicting two years ahead. See Dieleman et al. for a table that demonstrates the performance of four models, each with their optimal specification (as determined by the out-of-sample average percent deviation and total absolute error).<sup>1</sup>

### S3.2 Tracking development assistance for health from bilateral aid agencies and the European Commission

OECD-DAC maintains two databases on aid flows: 1) the DAC annual aggregates database, which provides summaries of the total volume of flows from different donor countries and institutions, and 2) the CRS, which contains project- or activity-level data.<sup>3</sup> This year, we used the DAC databases to track health ODA from 24 OECD-DAC members (Austria, Australia, Belgium, Canada, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, South Korea, Spain, Sweden, Switzerland, the United Kingdom, the United States, and the EC), and one DAC Participant country, United Arab Emirates, for the years 1990 to 2019. Observed data for the DAC members was available from 1990 to 2017, and observed data for the United Arab Emirates was available from 2009 to 2017. United Arab Emirates bilateral health ODA from 1990 to 2008 was obtained through personal correspondence.

These two DAC databases track the following types of resource flows:

Official development assistance (ODA), defined as “flows of official financing administered with the promotion of the economic development and welfare of developing countries as the main objective”<sup>2</sup> is tracked from its 30 members (Austria, Australia, Belgium, Canada, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Poland, Portugal, Slovakia, Slovenia, South Korea, Spain, Sweden, Switzerland, the United Kingdom, the United States, and the EC). The CRS also now includes some private ODA, such as that funded by BMGF and the Global Fund to Fight AIDS, Tuberculosis and Malaria (GFATM), as well as assistance from a number of non-DAC countries such as the United Arab Emirates and Kuwait.

ODA includes:

- Bilateral ODA, which is given directly by DAC members as aid to recipient governments, core contributions to NGOs and public-private partnerships, and earmarked funding to international organizations.

- Multilateral ODA, which includes core contributions to multilateral agencies such as WHO, UNFPA, GFATM, Gavi, UNAIDS, UNICEF, PAHO, the World Bank, and other regional development banks. Only regular budgetary contributions to these institutions can be reported to the OECD-DAC; hence, extrabudgetary funds, including earmarked contributions that donors can report as bilateral ODA, are not included as multilateral ODA. Only 70% of core contributions to WHO can be counted as multilateral ODA.

a. Official development finance (ODF), which includes grants and loans made by multilateral agencies.

b. Other official flows (OOF), which refers to transactions that “do not meet the conditions for eligibility as Official Development Assistance or Official Aid, either because they are not primarily aimed at development, or because they have a Grant Element of less than 25 percent.”

The DAC aggregate tables include all multilateral development banks, GFATM, operational activities of UN agencies and funds, and a few other multilateral agencies. The project-level data in the CRS cover a smaller subset of multilateral institutions, including UNAIDS, UNFPA, UNICEF, public-private partnerships including Gavi and GFATM, some development banks, and BMGF, but do not reflect the core-funded operational activities of WHO prior to 2009, disbursements by Gavi prior to 2007 and BMGF prior to 2009, or all loans from the World Bank.

This research utilized the CRS as the principal source for tracking bilateral DAH. This is because the DAC aggregate tables do not report detailed project-level information about the recipient country and health focus area. The OECD sector codes for general health (121), basic health (122), and population programs (130) were used to identify health flows in the CRS. Only ODA related flows are used in our analysis, including OECD flow codes corresponding to ODA grants (11), ODA grant-like (12), ODA loans (13), and equity investment (19). In addition, we included select projects with OECD sector code for emergency aid (720) in order to capture additional funding for ebola and zika outbreaks. Projects with purpose code emergency food aid (72040) were excluded, and the

remaining project descriptive variables were parsed for the keywords “EBOLA” and “ZIKA” to identify emergency aid projects targeting these diseases. Based on our definition of DAH, we also excluded any remaining projects containing any of the following keywords: " WATER " " SANITATION " " FOOD " " EARTHQUAKE " " HURRICANE " " TERREMOTO " " HURACAN " " FAMILY CARE STRUCTURES ".

To avoid double-counting, all identifiable earmarked commitments and disbursements between one disbursing agency to another were tagged and removed before calculating final DAH estimates. Income statements, expenditure statements, and keyword searches in the descriptive project fields were used to identify potential sources of double-counting.

In multilateral agencies, public-private partnerships, development banks, and foundations, when expenditure by recipient agency information was available, double counting was tagged and dropped in the disbursing agency from whom the resources was transferred. In the absence of detailed expenditure data in the disbursing agency that transferred resources, the income statement of the receiving disbursing agency that reflected the disbursement was used to flag the disbursement in the initial disbursing agency. Preliminary estimates were generated based on the annual disbursed envelope exclusive of resources flagged as transfers to other agencies.

Channel codes in the CRS data were used to track DAH to international and donor-country-based non-government organizations. The names of NGOs that were captured in IHME’s NGO data (as detailed in section 3.7 titled “Tracking non-governmental organizations”) were searched for in the CRS descriptive variables and tagged as double-counting. Research funds for HIV/AIDS channeled by the US government through the National Institutes for Health (NIH) were also removed from the total since they do not meet the definition of DAH as contributions from institutions whose primary purpose is development assistance. Official development finance (ODF) from the CRS was not counted because these expenditures were included elsewhere, either in the analysis of multilateral institutions relevant to the study or in the assessment of health spending by BMGF, the data for which were obtained via correspondence and from their annual reports, audited financial statements, and project databases. To avoid double-counting, only health assistance flows from multilateral institutions to low- and middle-income countries were counted, and not transfers to multilateral institutions. Also, for regional projects the disbursements are split amongst all countries in the specified OECD region. For example, a project allocated to recipient “North of Sahara, regional” would have its disbursements split equally between all the countries in the corresponding OECD region: Algeria, Egypt, Libya, Morocco, and Tunisia.

Allocation of funding to health focus areas was assigned as described in the section “DISAGGREGATING BY HEALTH FOCUS AREA”, based on a keyword search of five descriptive variables in the CRS: project title, short description, long description, channel name, and channel reported name. Additional adjustments were made based on CRS purpose codes, as detailed in Table S3.5, in order to ensure that the specified purpose corresponded to the highest-weighted **bilateral** health focus area.

### S3.2.1 Estimating disbursements for the 24 channels and the EC

Both the DAC tables and the CRS rely on information reported by DAC members and other institutions to the OECD-DAC. Hence, the quality of the data varies considerably over time and across donors. Three variables were used to estimate yearly donor disbursements: CRS commitments, CRS disbursements, and DAC commitments. There were two main challenges in using the data from the CRS for this research:

1. underreporting of aid activity to the CRS compared to what is reported to the DAC, and
2. underreporting of disbursement data to the CRS compared to commitment data reported to the CRS.

These issues are highlighted in Figure S3.1. Methods developed to account for both these challenges are discussed below. Details on how we estimated the cost of providing technical assistance and program support for these institutions are highlighted below in the section titled calculating the ‘Technical assistance and program support component of development assistance for health from loan-and grant-making channels of assistance’.

To address these two challenges, we determined a cutoff point for each channel. We defined this channel-specific cutoff year as when the ratio of total CRS disbursements to commitments was greater than 50% and did not drop subsequently below 30%. Figure S3.2 below shows each donor's CRS disbursement to commitment ratio in green, and the estimated cutoff year is marked with a vertical red line. For years after the cutoff year, DAH is measured using the unadjusted disbursement data. For the time prior to the cutoff year, it was determined that the disbursement data are not of high enough quality, and adjusted commitments were used instead.

Two adjustments were made to commitments to estimate disbursements before each donor-specific cutoff point:

- I. The first adjustment addressed underreporting of aid activity to the CRS (relative to the DAC). To address this challenge, all CRS commitments for the health sector were adjusted upward using the DAC commitment to CRS commitment coverage ratio. The coverage ratio of the CRS was well below 10% before 1996 but has improved steadily over time.
- II. The second adjustment addressed underreporting of disbursements data to the CRS (relative to commitments reported to the CRS). To address this challenge, we pooled completed projects in the CRS that have disbursement data for each channel and computed yearly project disbursement rates (the fraction of total commitments disbursed for each year of a project) and overall project disbursement rates (the fraction of total commitments disbursed over the life of each project) by project length. Yearly disbursement schedules were calculated for projects with lengths of one, two, three, four, five, and six years. When an observed project length was more than six years, all expenditure after the sixth year was aggregated and assumed to be expended in the sixth year. This does not happen often. Yearly disbursement rates were the median of these shares, averaged across projects for every donor in each project year. The sum of these averages equals one, so that all the disbursements were expended over the lifetime of a project. We also adjusted donor disbursement schedules by the ratio of disbursements to commitments in the CRS in order to reflect the fact that not all commitments are typically disbursed. The product of these donor-specific yearly disbursement rates, the donor-specific overall disbursement rates, and the donor-specific disbursement to commitment ratios produced the donor-specific disbursement schedules. The donor-specific disbursement schedules were applied to project-level DAC-adjusted commitments reported in the CRS. Figure S3.3 shows the yearly disbursement rates and overall disbursement rates for projects with one- to six-year lifespans for each of the 24 member countries and the EC.

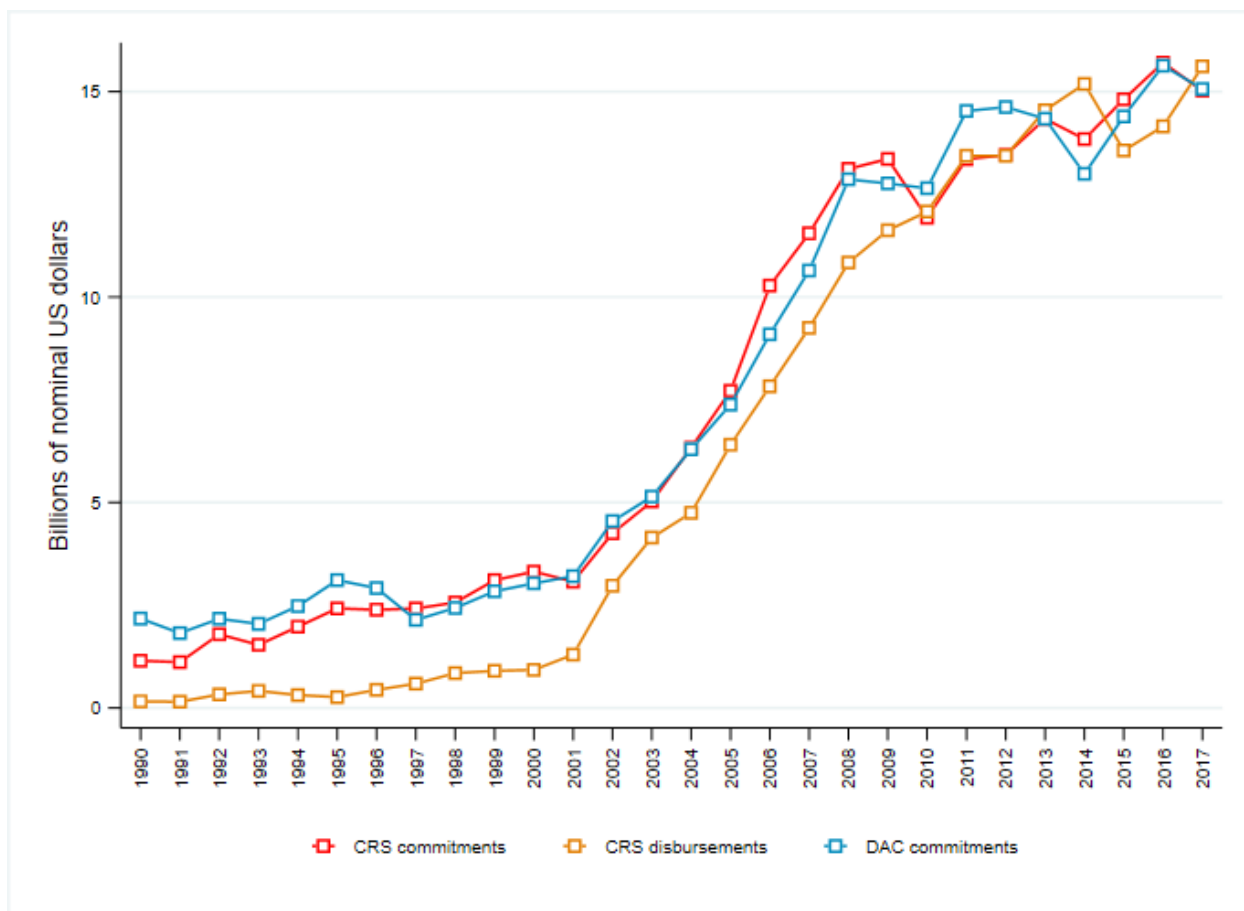

Lastly, to address the challenge of underreporting of aid activity to the CRS compared to the DAC for all years, the difference between each donor's aggregate DAC health commitments and CRS health disbursements was added to each donor's yearly DAH. Since only aggregate commitments are reported to the DAC, several adjustments were made, based on more detailed CRS data:

- I. First, each donor's yearly median project length was calculated by applying the donor-specific disbursement schedules described above to CRS projects that had disbursement in order to get adjusted DAC commitments.
- II. Commitments for projects that have not opened yet were then subtracted, based on the open date reporting in the CRS. This ensured that future disbursements were not captured.
- III. The donor-specific ratio of disbursements to commitments was applied to adjusted DAC commitments in order to account for the fact that not all commitments are usually disbursed.
- IV. Lastly, these DAC-adjusted commitments were compared to CRS disbursements, inclusive of transfers that were later dropped as double-counting.

In addition to tracking disbursements from the EC, gross disbursements from the DAC were used to compile data on the sources of funding for the EC.

**Figure S3.1 Comparing CRS commitments, CRS disbursements, and DAC commitments**

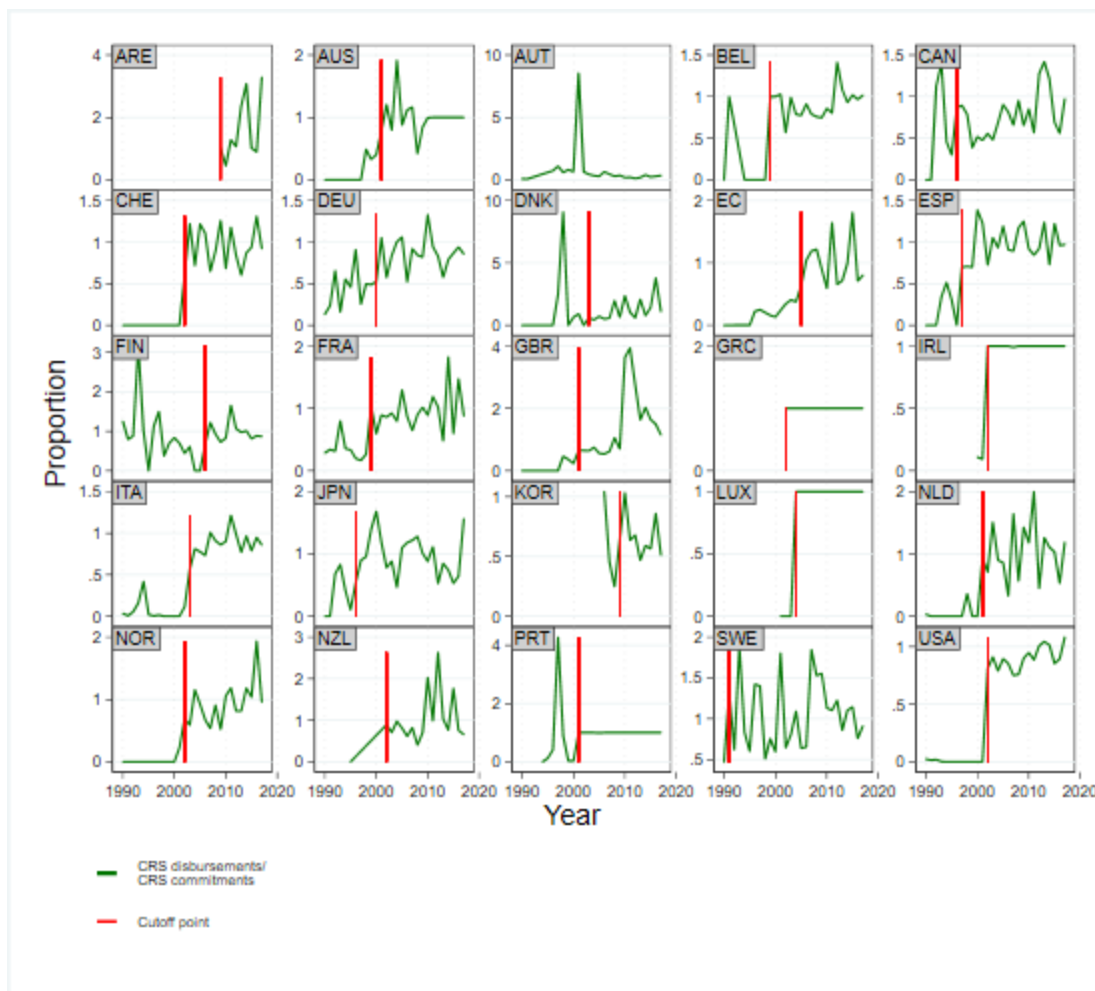

This figure compares commitments and disbursements from the Creditor Reporting System (CRS) and Development Assistance Committee (DAC) databases of the Development Assistance Committee of the Organisation for Economic Co-operation and Development (OECD-DAC) from 1990 to 2017. CRS disbursements are usually underreported when compared to both CRS and DAC commitments data, especially in earlier years. Because of this gap between CRS and DAC, CRS disbursements data were adjusted to fit DAC commitments data.

Source: OECD-DAC and OECD Creditor Reporting System

**Figure S3.2 CRS disbursement to commitment ratio and cutoff points by donor agency**

This figure shows the channel-specific cutoff year. Before this year, we adjust CRS commitments using disbursement schedules. After this cutoff we rely on CRS-reported disbursements. The total CRS disbursements to commitments ratio is in green, and the cutoff year is marked with a vertical red line. The cutoff year is determined to be when the ratio goes above 50% and does not fall back below 30%. The vertical axis represents the CRS disbursement to commitment ratio as a percentage. ARE = United Arab Emirates, AUS = Australia, AUT = Austria, BEL = Belgium, CAN = Canada, CHE = Switzerland, DEU = Germany, DNK = Denmark, EC = European Commission, ESP = Spain, FIN = Finland, FRA = France, GBR = Great Britain, GRC = Greece, IRL = Ireland, ITA = Italy, JPN = Japan, KOR = South Korea, LUX = Luxembourg, NLD = the Netherlands, NOR = Norway, NZL = New Zealand, PRT = Portugal, SWE = Sweden, USA = United States of America.

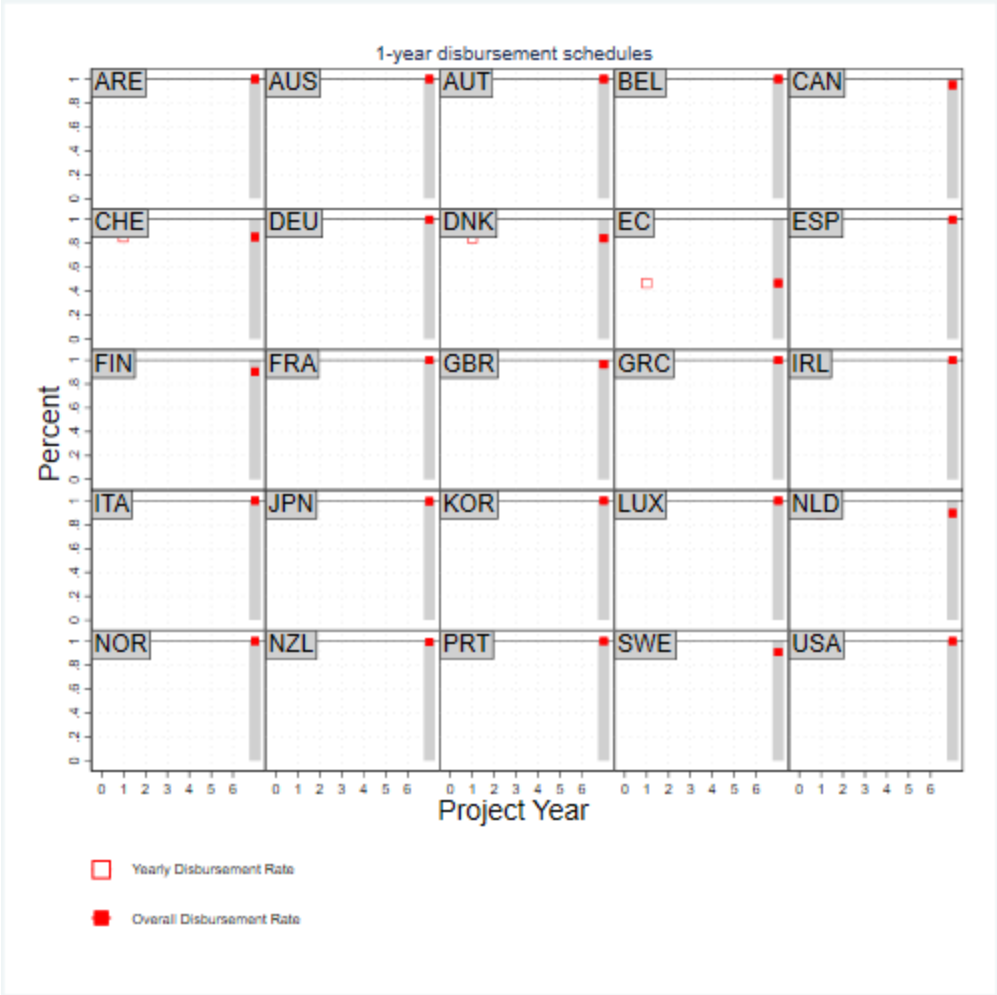

Source: OECD Creditor Reporting System

**Box 3.3. EXAMPLE. Australia’s CRS disbursement to commitment ratio and cutoff year**

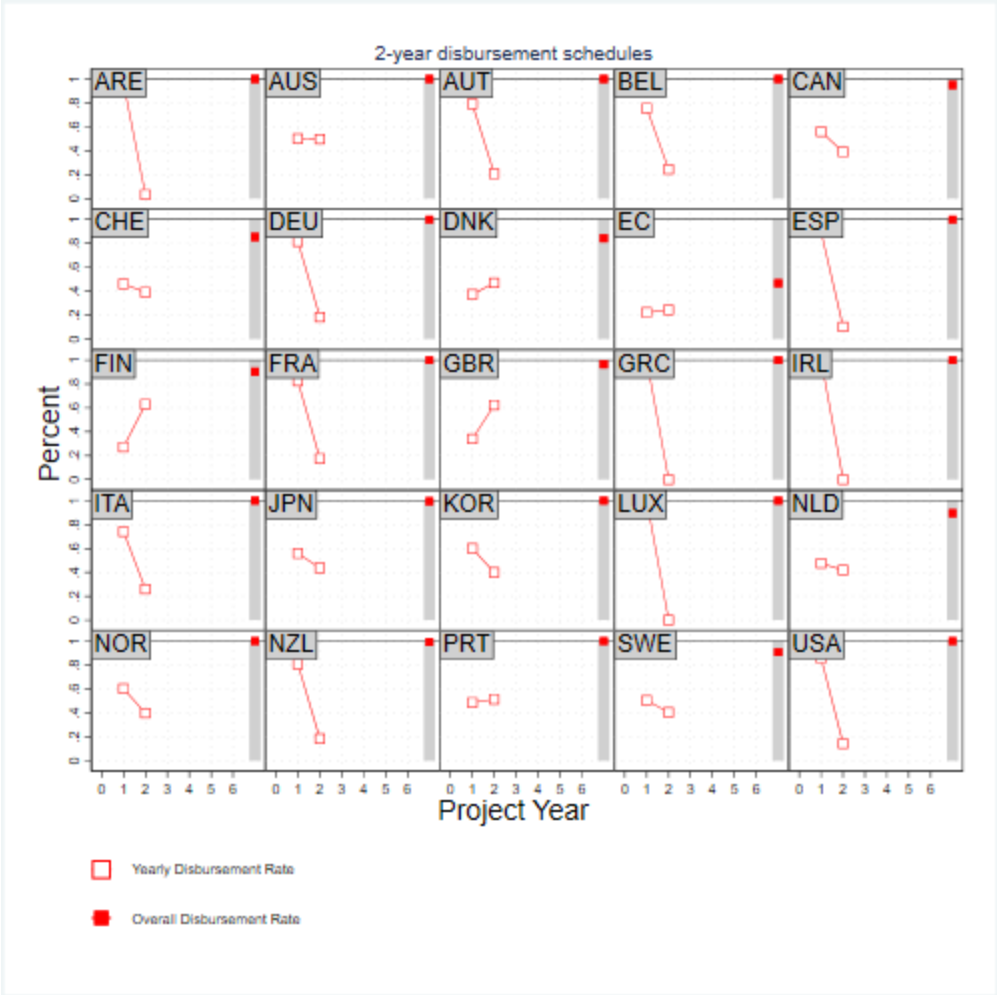

The green line shows the ratio of Australia’s disbursements to commitments, as reported in the CRS. Prior to 2001, the ratio was always below 50%. In 2001, the ratio rose above 50%; it did not fall below 30% in subsequent years, thereby defining 2001 as the cutoff year. Thus, for Australia, before 2001 DAH is based on adjusted CRS commitment data. These data are adjusted using disbursements schedules (Figure S3.3) and data from the DAC. After 2001, Australia’s DAH is based on the disbursements reported in the CRS.

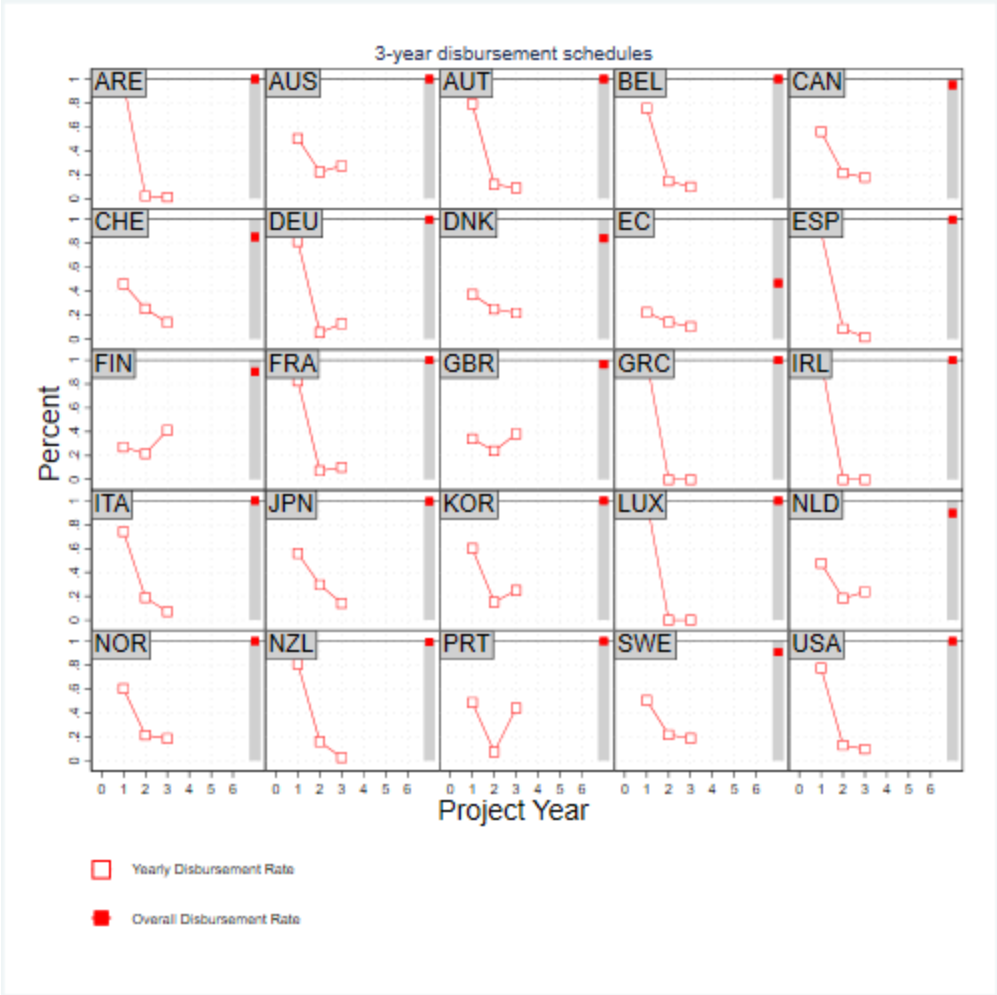

**Figure S3.3 One- to six-year disbursement schedules for bilateral channels**

This figure shows the estimated disbursement schedules for bilateral channels. Before the channel-specific cutoff year, we rely on commitment data to inform our estimates of DAH. Commitment data are adjusted to reflect disbursements over time using schedules estimated from projects in the CRS that have both commitment and disbursement data. The vertical axis represents the percentage of the commitment disbursed. ARE = United Arab Emirates, AUS = Australia, AUT = Austria, BEL = Belgium, CAN = Canada, CHE = Switzerland, DEU = Germany, DNK = Denmark, EC = European Commission, ESP = Spain, FIN = Finland, FRA = France, GBR = Great Britain, GRC = Greece, IRL = Ireland, ITA = Italy, JPN = Japan, KOR = South Korea, LUX = Luxembourg, NLD = the Netherlands, NOR = Norway, NZL = New Zealand, PRT = Portugal, SWE = Sweden, USA = United States of America

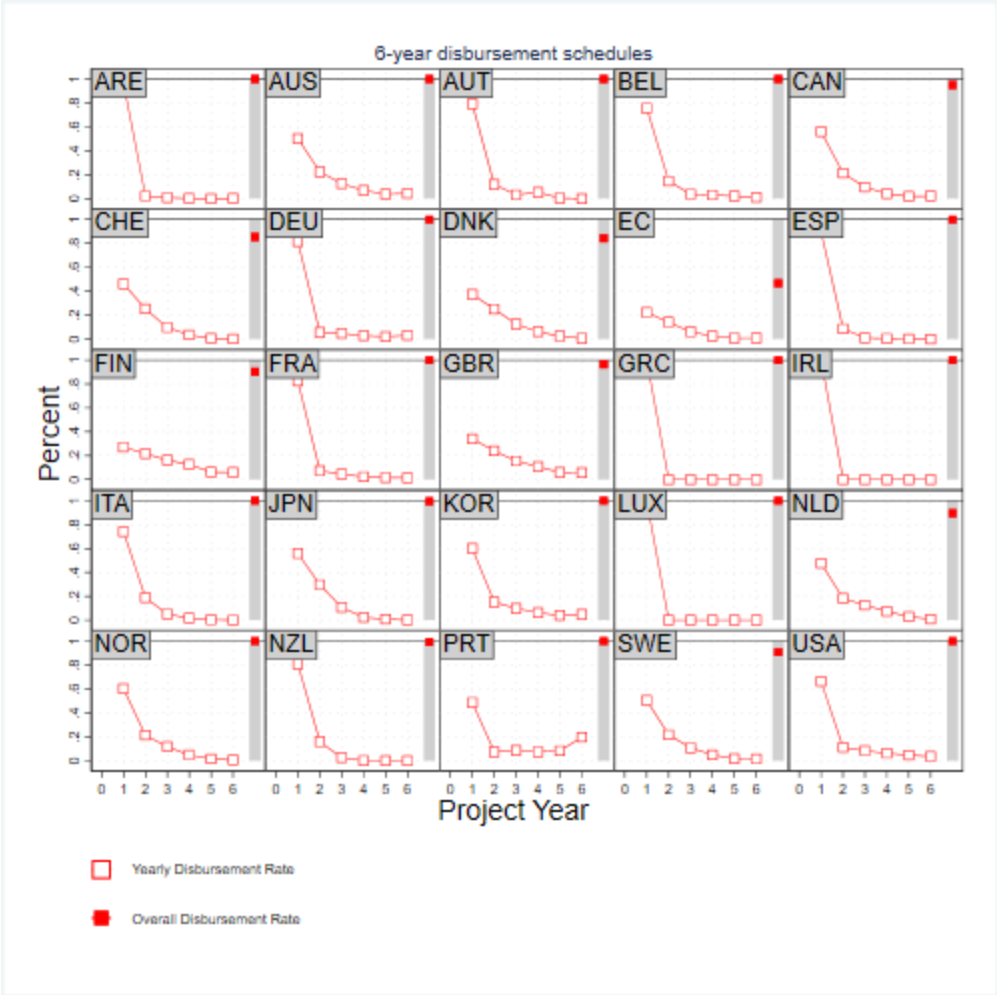

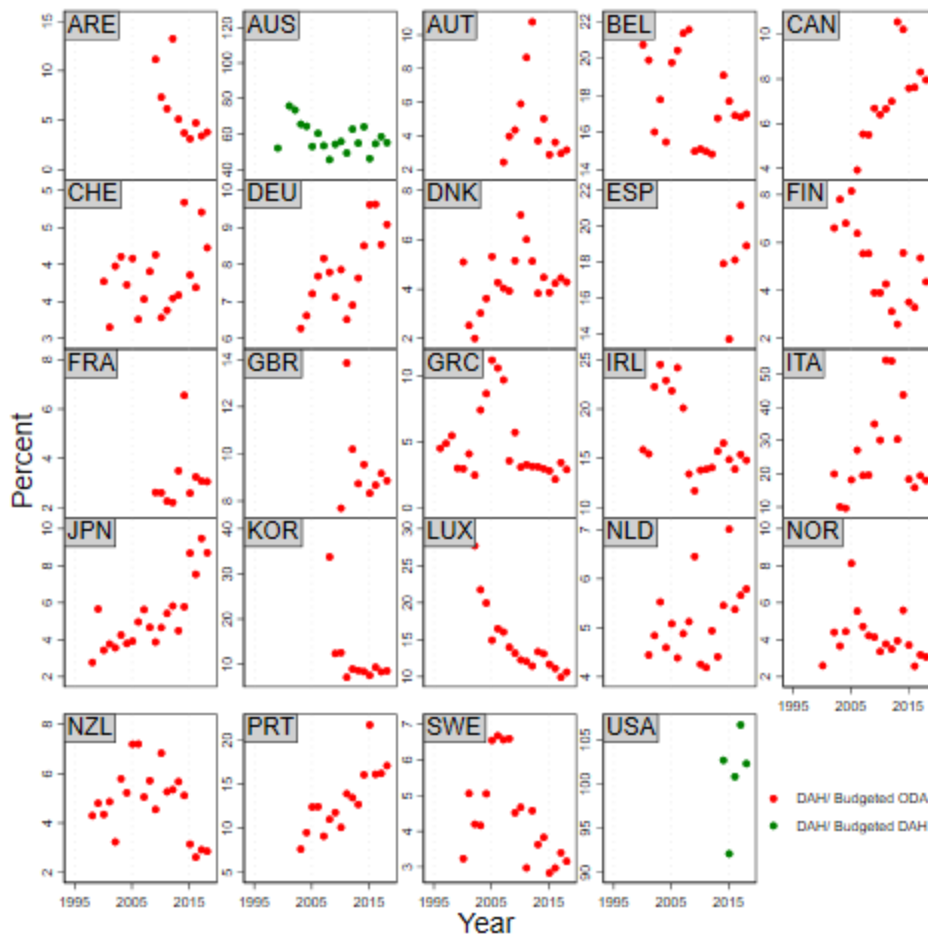

**Box 3.4. EXAMPLE. Australia’s one- to six-year disbursement schedules**

To estimate disbursements using commitment data, we rely on disbursement schedules derived from CRS data that include both commitments and disbursements. Disbursement schedules are specific for each channel and the length of a project. These schedules also take into consideration the average amount of commitments for each channel that lead to disbursements. Across all Australian projects in the CRS with complete disbursements data, Australia disbursed 100% of the funds that it committed, as shown by the solid red dot on the right-hand side of the Australia panel (upper left corner of the first panel of Figure S3.3). In projects with a length of one year, Australia disbursed 100% of the funds that it committed in that year. For two-year projects, Australia disbursed 50% of total disbursements in year one and 50% of total disbursements in year two. In projects with lengths of three years, Australia disbursed about 50% of total disbursements in year one and 23% and 27% of total disbursements in years two and three, respectively. This is estimated for projects ranging from one to six years. The disbursement schedules were applied to commitment data from the CRS to estimate disbursements for years prior to the cutoff year, which is 2001 for Australia.

To predict DAH for the recent years not reported in the CRS, budget data were extracted from a variety of sources. These data are listed in Table S3.3. Global health budgetary data were utilized whenever possible, but these detailed data were available as a complete time series only for Australia and the United States. For all other bilateral channels, general ODA budgets were used. In order to predict DAH for 2018-2019 for 24 bilateral agencies, the budget ratio for each donor was calculated by dividing DAH estimates by the corresponding budget data (ODA or global health). Budget ratios were projected using a weighted average of the previous three years (placing one-half weight on the one-year lagged ratio, one-third weight on the two-year lagged ratio, and one-sixth weight on the three-year lagged ratio), and this ratio was multiplied by the observed budgeted DAH for those same years. Figure S3.4 plots the budget ratio for each bilateral channel. Budget data for the EC were inconsistent and did not match the disbursement series. Instead, DAH for 2018-2019 was estimated based on trends in DAH for EC member countries. A weighted average was applied to the percent change in DAH from 2016-2019 for all EC member countries. The weighting was based on each country’s total national contributions to the EC. These data were collected from the EC’s financial statements.<sup>74</sup> The weighted average was then applied to the EC’s 2017 DAH to forecast 2018-2019.

**Figure S3.4 DAH as a percentage of corresponding budget data by bilateral agency**

This figure shows the trend of the ratio of DAH measured as a share of budget data. Green dots indicate that a donor provided global-health-specific budget data, so in these cases the denominator is all global-health-specific budgeted data. The numerator is estimated DAH. Red dots indicate that a donor did not have global-health-specific budget data, so overall ODA budget data were used in calculating the DAH to budget ratios. The vertical axis represents estimated DAH as a fraction of corresponding budget data. ARE = United Arab Emirates, AUS = Australia, AUT = Austria, BEL = Belgium, CAN = Canada, CHE = Switzerland, DEU = Germany, DNK = Denmark, ESP = Spain, FIN = Finland, FRA = France, GBR = Great Britain, GRC = Greece, IRL = Ireland, ITA = Italy, JPN = Japan, KOR = South Korea, LUX = Luxembourg, NLD = the Netherlands, NOR = Norway, NZL = New Zealand, PRT = Portugal, SWE = Sweden, USA = United States of America.

Source: IHME DAH Database (2019) and corresponding bilateral ODA/DAH budget documents outlined in Table S3.1 and 3.3.

**Box 3.5. EXAMPLE. Australia’s DAH as a percentage of corresponding budget data**

Australia provided global-health-specific budget data for 1998-2019 through its International Development Assistance and Overseas Aid Program budgets. For 1998-2017, health ODA and observed DAH were used to create DAH to budget ratios. These budget ratios were then applied to 2018-2019 health ODA budget data to project DAH in 2018-2019, using a weighted average:

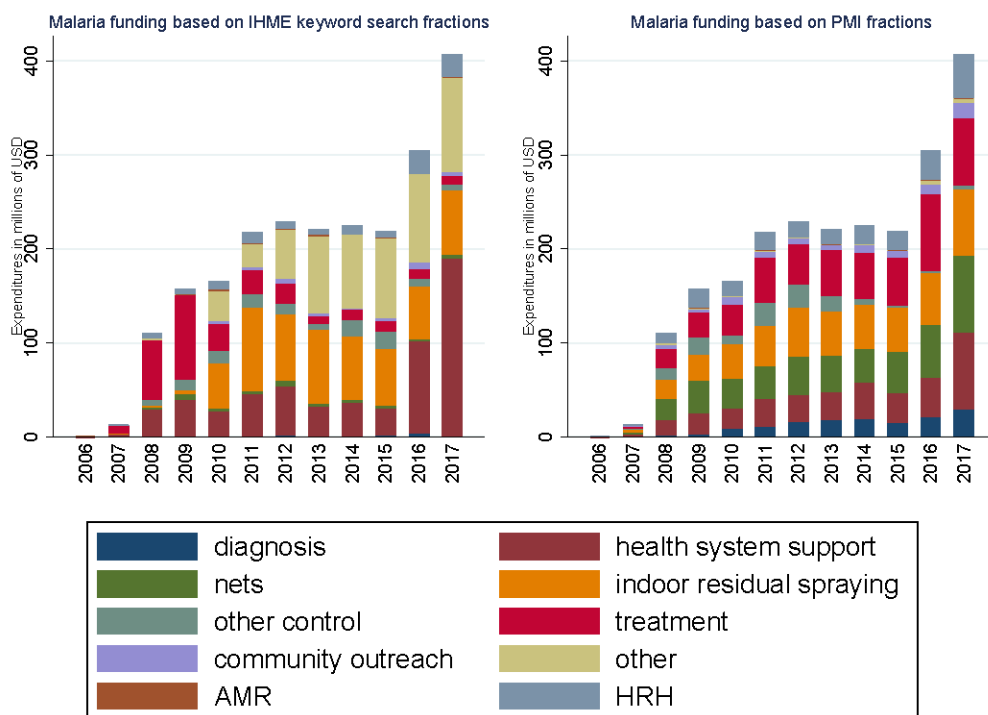

$$(Total\ DAH_t) = \left(\frac{1}{2}\right) (Budget\ ratio_{t-1}) (Budgeted\ GHE_t) + \left(\frac{1}{3}\right) (Budget\ ratio_{t-2}) (Budgeted\ GHE_t) + \left(\frac{1}{6}\right) (Budget\ ratio_{t-3}) (Budgeted\ GHE_t)$$

where t = year to be modeled.

To supplement our estimates of development assistance for health to HIV/AIDS and malaria program areas for the United States, we used additional available data from the President’s Emergency Plan for AIDS Relief (PEPFAR) and the President’s Malaria Initiative (PMI). We downloaded data on all planned funding by PEPFAR by recipient country, year, and program area from 2004 to 2019.<sup>75</sup> All PEPFAR projects were assigned to our eight HIV/AIDS program areas using PEPFAR budget codes, splitting out overhead costs equally to all other program areas. We then created country-year specific HIV/AIDS program area fractions out of total annual HIV/AIDS DAH, which we applied to all United States HIV/AIDS projects in the CRS from 2004 to 2017 by country-year. To inform malaria

funding by program areas, we downloaded the most recently available malaria funding tables from malaria operational plans for all countries and years.<sup>76</sup> We used a keyword search to assign each line item in these tables to our eight malaria program areas, and then created fractions for the malaria program areas out of the total annual malaria DAH specific to each country-year. These fractions were applied to all United States malaria projects in the CRS from 2006 to 2017 by country-year.

**Figure S3.5 Malaria DAH to program areas as assigned by keyword search and PMI reports**

Source: IHME DAH Database (2019) and PMI malaria operational plans

This figure outlines the assignment of funding to malaria program areas for United States projects from the OECD CRS from 2006 onwards. The figure on the left shows how malaria funding is broken out based on keyword search. The figure on the right shows the breakdown of funding to malaria program areas based on PMI malaria funding tables. Using the data from PMI reduces the amount of funding allocated to the “other” program area. As such, in as often as more disaggregated information on project allocation is available, IHME uses such project information available in project budget documents or other project documents to disaggregate into program areas.

### S3.3 Tracking development assistance for health from the development banks

The World Bank project-level health disbursement data for 1990 through September 2019 were obtained through correspondence with Kathleen E. Krackenberger and Miyuki T. Parris, Operations Analysts.<sup>77</sup> The World Bank recently underwent a recoding process for their disbursements. This recoding affected health disbursements, however the recoding was not completed for projects with disbursements prior to 2001. To create a comparable dataset adjustments had to be made. Regression analysis to predict health disbursements were explored, however, in the end the average percent change between project-level health disbursements before and after recoding was used

to adjust health disbursements prior to 2001. It was observed that on average, between 2001 and 2005 (inclusive) the recoding process decreased health disbursements by 0.22%. This number was used to adjust all project-level health disbursements prior to 2001.<sup>78</sup> Health disbursements included all health projects as well as other sector projects with a health sector code. In addition, data were collected from the World Bank online loans database in order to fill in descriptive information for loans from the two arms of the World Bank: the International Development Association (IDA) and the International Bank for Reconstruction and Development (IBRD).<sup>79</sup> Along with keyword searches, health theme codes were used to allocate disbursements by health focus area. The online database contains up to five sector codes and five theme codes that can be assigned to each project. Sector codes represent economic, political, and social subdivisions, while theme codes represent the goals or objectives of World Bank activities. The codes are summarized in Table S3.6. Emergency recovery loans were excluded since they do not fit the definition of DAH.

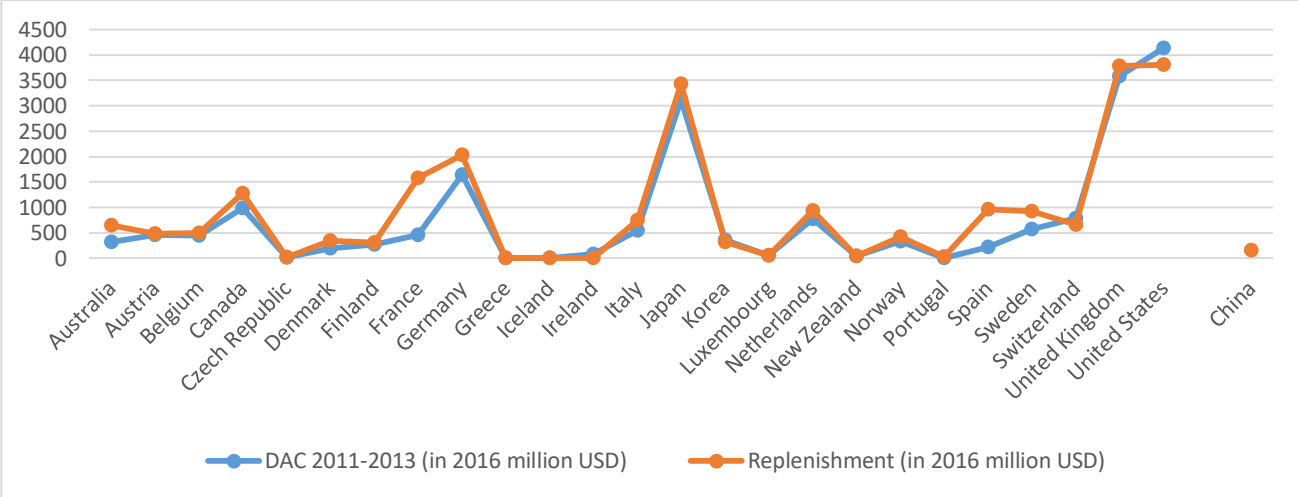

**Table S3.6 World Bank’s health sector and theme codes**

<b>Health sector codes</b> <b>Sector codes represent economic, political, or social subdivisions within society. World Bank projects are classified by up to five sectors.</b>	<b>Health theme codes</b> <b>Theme codes represent the goals or objectives of World Bank activities.</b>
<b>Historic (prior to 2001):</b> (1) <b>Basic health</b> (2) <b>Other population health and nutrition</b> (3) <b>Targeted health</b> (4) <b>Primary health, including reproductive health, child health, and health promotion</b>  <b>Current (as of 2001):</b> (1) <b>Health</b> (2) <b>Compulsory health finance</b> (3) <b>Public administration – health</b> (4) <b>Noncompulsory health finance</b>	<b>Current:</b> (1) HIV/AIDS (2) Malaria (3) Tuberculosis (4) Other communicable diseases (5) Population and reproductive health (6) Child health (7) Nutrition and food security (8) Injuries and non-communicable diseases (9) Health system performance (10) Social analysis and monitoring

Data on yearly government contributions were obtained from the DAC statistics in order to disaggregate IDA flows by source. Because China does not report to DAC, we generated contribution estimates using replenishment data. We split the 3-year replenishment amount over the three years of the 16th-19th replenishment, to obtain China’s contributions to the World Bank from 2008-2017. We validated our use of replenishment data by extracting China’s and other countries’ contributions to the World Bank International Development Association (IDA) 16th, 17th and 18th replenishment and comparing the number with the contribution we extracted from the OECD Creditor’s Reporting System (CRS)<sup>80</sup>. The trend of contribution from major donors was similar, we therefore used China’s replenishment contribution as a proxy of the contribution to World Bank IDA. We further disaggregated the DAH contribution to World Bank IDA from China by multiplying China’s contributing proportion over World Bank IDA’s total health envelope.

**Panel a. Comparison of World Bank International Development Association 16<sup>th</sup> Replenishment**

**Panel b. Comparison of World Bank International Development Association 17<sup>th</sup> Replenishment**

**Panel c. Comparison of World Bank International Development Association 18<sup>th</sup> Replenishment**

### Figure S3.6 Comparison of World Bank IDA Replenishment and DAC

The three figures show the comparison of country commitment to World Bank IDA replenishment rounds, and yearly government contributions reported to DAC statistics. The orange line shows the country commitment to each IDA replenishment round. The blue line shows the sum of yearly reported contribution during the three-year replenishment round. Panel a is contributions and commitments from replenishment round 16; panel b is contributions and commitments from replenishment round 17; panel c is contributions and commitments from replenishment round 18.

Details on how we estimated the cost of providing technical assistance and program support for these institutions are highlighted below in the section titled “Calculating the technical assistance and program support component of development assistance for health from loan-and grant-making channels of assistance.” The data received from the World Bank captured disbursements for Jan 1st to Sep 15th of 2019, so the 2019 total estimate for IDA and IBRD were rescaled to 12 months.

#### S3.3.1 Regional development banks

The Asian Development Bank (ADB), and Inter-American Development Bank (IDB) all maintain their own loan databases, which were used to estimate disbursements.<sup>15,16,81</sup> To estimate health disbursements from the African Development Bank (AfDB), data was received via correspondence with Mr. Yomi Ayodabo (Division Manager, Loan accounting).<sup>35</sup> To estimate health disbursement from the Asian Development Bank (ADB), data were received via correspondence with Dr. Rouselle F. Lavado. Table S3.7 provides a summary of the data sources used across the regional banks. Furthermore, Figure S3.6 displays the disbursements for AfDB from 1990 to 2019 and eFigures 3.7, and 3.8 display commitments and disbursements from 1990 to 2019 for ADB and IDB.

For AfDB, we received project level disbursement data from 2001 through 2019. For pre-2001 estimates, data from the Compendium of Statistics were used. Donor information for projects funded by the African Development Fund was based on subscription information from the 9<sup>th</sup> to 14<sup>th</sup> replenishment reports<sup>82</sup>. The sole donor to projects implemented by the Nigeria Trust Fund was Nigeria, and all income for African Development Bank projects was attributable to other sources.

For ADB, we received project-level disbursement data from 1990 through 2019, including recipient, project title and description and annual disbursement. A keyword search was performed to identify health focus areas of the projects. For income source of ADB, data for country donations were extracted from the replenishment reports of Asian Development Fund and we manually divide the three or four years’ replenishment into annual contributions<sup>83</sup>. We extracted the total revenue of Ordinary Capital Resources and Asian Development Fund from the Financial reports of ADB to generate the total envelope of income sources and subtracted the country contribution to provide the estimate for resources coming from the bank itself. Using the fraction for the Bank’s own resources and country contribution, we provided the estimate of income source for each project.

The IDB’s project database also provided commitments and disbursements for all projects. The same methods were used for estimating annual disbursements from the IDB as were used for the ADB. Through correspondence, 2019 health loan disbursements were obtained. These numbers were used in the 2019 estimates. The dataset used to estimate disbursements for IDB was updated in November 2019. However, since these channels have so few new projects each year, it was assumed that smoothing disbursements over time for reported projects captured the majority of total disbursements for 2019. The contribution quotas by donor for the Fund for Special Operations from 1990-2016 were extracted from Annual Financial reports for the IDB. The ratio of each donor’s contribution to total contribution was applied to total disbursements to assign income sources. In 2017, the Fund for Special Operations was transferred to the Ordinary Capital. Donor assignments in 2017 onwards are unallocable.

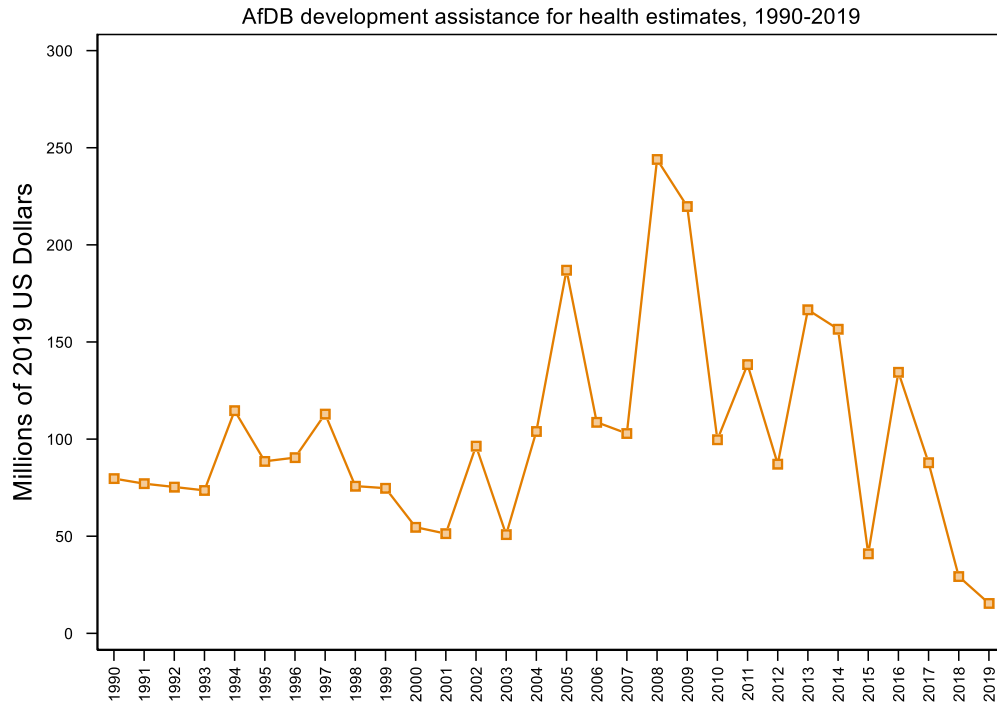

**Table S3.7 Summary of data sources for the regional development banks**

This figure indicates the data available and used to estimate DAH. (X) indicates that project-level data are present in the dataset. (-) indicates that project-level data are not present in the dataset.

<b>Institution</b>	<b>Data source</b>	<b>Commitments</b>	<b>Cumulative disbursements</b>	<b>Yearly disbursement</b>	<b>Notes</b>
<b>African Development Bank (AfDB)</b>	Compendium of Statistics	X	-	(Aggregate - not at the project level)	The Compendium of Statistics was not available for 1990-1993, 1995, and 1998-1999; we estimated yearly disbursements using the average of neighboring disbursements
	Correspondence	-	-	X	Annual loan disbursements from 2001 through August 2019 were provided.
<b>Asian Development Bank (ADB)</b>	Correspondence	X	X	X	Annual grant loan disbursements from 1990 through 6 November 2019 were provided.
<b>InterAmerican Development Bank (IDB)</b>	Online projects database	-	X	-	As yearly disbursement amounts are not provided in the online database, we estimated yearly disbursements by allocating cumulative disbursements over each year of the project.
	Correspondence	-	-	X	Loan disbursements from January through 4 September 2019 were provided.

### Figure S3.7 Disbursements by the African Development Bank

The orange line with squares shows estimated disbursements based on the Compendium of Statistics from 1990 through 2001 and actual disbursements received from 2001 onwards.

### S3.4 Tracking contributions from GFATM and GAVI

#### The Global Fund to Fight AIDS, Tuberculosis and Malaria

The grants database made available online by the Global Fund to Fight AIDS, Tuberculosis and Malaria (GFATM) provides grant-level commitments and annual disbursements from its inception in 2002 to the present year.<sup>22</sup> In addition, sources of funding were compiled from the GFATM contributions dataset and annual reports, all downloaded from the GFATM website.<sup>23,24</sup> Regional grants were split evenly between all countries identified in the regional grant documents found on the GFATM website. Figure S3.10 shows GFATM’s annual contributions received from public and private sources. Figure S3.10 shows GFATM’s annual commitments and disbursements from its project database from 2002 through 2019.

Figure S3.10 Contributions received by the Global Fund to Fight AIDS, Tuberculosis and Malaria

**Figure S3.11 The Global Fund to Fight AIDS, Tuberculosis and Malaria’s commitments and disbursements**

The dashed green line shows commitments from the Global Fund to Fight AIDS, Tuberculosis and Malaria’s (GFATM) online grants database. The orange line shows disbursements from the online grants database.

Source: IHME DAH Database (2019)

### S3.4.1 Gavi, the Vaccine Alliance

Gavi provided publicly available project-level data on commitments, disbursements, and investment cases from 2000 through the present.<sup>18,21</sup> Gavi’s annual DAH was defined as the sum of (1) project-level disbursements by year paid; (2) investment cases (one-time investments in disease prevention and control); and (3) administrative and work plan costs. Data from Gavi’s online databases include expenditure for (1) and (2), but not (3). However, project level data from the CRS for 2007-2012 did include administrative and work plan costs, so disbursements data from the online database were adjusted to match the CRS in those years. The average fraction of administrative and work plan costs was added to total disbursements in 2000-2006 and 2013-2015, the years in which the CRS did not include these data. Contributions data from Gavi’s website as well as annual reports from the International Finance Facility for Immunisation (IFFIm) and Advance Market Commitment for Pneumococcal Vaccines were used to determine Gavi’s annual income.<sup>19,20,84</sup>

All of the data sources used for Gavi estimates were complete through 2018. Donor contributions received and outstanding pledges data were available on Gavi’s website. The unadjusted total pledges were used as total disbursements for 2019. Gavi disbursements were assigned to health focus areas including child and newborn vaccines, HSS, and non-communicable disease as documented in Table S3.7 above. Of note, we reclassified all GAVI health system strengthening projects as maternal, newborn, child health specific health system strengthening disbursements

**Figure S3.12 Gavi’s income and disbursements**

The dashed green line shows commitments from Gavi’s online database. The dashed orange line shows the disbursements from Gavi’s online database, which are the sum of project-level disbursements and investment cases. These data are adjusted using Gavi expenditure data reported to the Creditor Reporting System (CRS) to add administrative and work plan costs to the total. Adjusted disbursements are shown by the solid orange line.

Source: IHME DAH Database (2019)

### S3.4.2 Coalition for Epidemic Preparedness and Innovation

CEPI provided a complete dataset of all disbursed funding by disease from 2017-2019 and all income received from donors from 2018-2019. Funding data was provided per target vaccine and were classified between the other infectious diseases health focus area and the health systems strengthening other infectious diseases health focus area. Since CEPI donor data spans from 2017-2019, the proportions by donor for 2017-2018 was applied to total disbursements in 2018.

### S3.5 Tracking expenditure by United Nations Agencies active in the health domain

Data on income and expenditures were collected for six UN agencies: WHO, UNICEF, UNFPA, UNAIDS, UNITAID and PAHO. The data sources and calculations for each are described in detail below. Similar to the bilateral channels, we extracted budget data for the UN agencies to predict DAH for years for which we did not have health expenditure data. Model choices and budget measures for UN agencies are presented in Table S3.3.

### **S3.5.1 World Health Organization**

Data on WHO's budgetary and extrabudgetary income and expenditure were compiled from annual reports and audited financial statements released by WHO.<sup>85</sup> Income data were extracted from WHO's assessed and voluntary contributions, while expenditure data were extracted from both budgetary and extrabudgetary spending reports. For financial statements representing activities over a two-year period, both income and expenditure data were divided by two, in order to approximate yearly amounts, and dollars were deflated using the US GDP deflator specific to the reporting year. Expenditures from trust funds, regional offices tracked separately, and associated entities not part of WHO's program of activities, such as UNAIDS and GFATM trust funds were excluded. Expenditures from supply services funds were also excluded, as these expenditures pertain to services provided by WHO but paid for by recipient countries. Additionally, WHO projects tracked as paid Ebola expenditure were extracted from the UNOCHA Financial Tracking System database and included as WHO health expenditure.

Disbursement data were not available for WHO in 2019. Much like the bilateral agencies, the ratio of DAH to the total program budget was estimated for 1990-2018 and then predicted for 2019 using the single-year average of previous year. The predicted ratio was then multiplied by the observed program budget for 2019 to get the estimates of DAH.

### **S3.5.2 United Nations Population Fund**

Data on income and expenditure were extracted for UNFPA from its audited financial statements.<sup>72</sup> As the 1990-2005 statements represent activities over a two-year period, income and expenditure data were divided by two in order to approximate yearly amounts.

Income and expenditures associated with procurement and cost-sharing activities were excluded from estimates of health assistance because UNFPA uses cost-sharing accounts when a donor contributes to UNFPA for a project to be conducted in the donor's own country. Since this money can be considered domestic spending that goes through UNFPA before being returned to the country in the form of a UNFPA program, it is not included in calculations of total DAH. UNFPA's additional expenditures for these projects come from trust funds or regular resources and are therefore, captured in our estimates. To estimate disbursements by health focus areas, UNFPA's total health expenditure was multiplied by the proportion of funding reported for each program area from annual reports from 1997 through 2013, from the UNFPA transparency portal for 2014 through 2018, and from the 2018 Statistical and Financial Review for 2019. Maternal and child health spending classified as "other" was split equally between the maternal and child health program areas. Health spending in 2018 that was classified as towards "Integrated sexual and reproductive health services" was split equally between maternal health, family planning, other reproductive health and other HIV/AIDS program areas. Additionally, UNFPA projects tracked as paid Ebola expenditure were extracted from the UNOCHA Financial Tracking System database and added to UNFPA health expenditure.

The disbursement data for UNFPA were available through 2018. For year 2019, the ratio of DAH and income was estimated to be the same as that for 2018. This approach was used rather than implementing a three-year weighted average of ratios because the change in funding structure was assumed to persist for the near future. The predicted ratio was then multiplied by observed income to estimate DAH for 2019.

### **S3.5.3 United Nations Children's Fund**

Data on income and expenditure for UNICEF were extracted from its audited financial statements.<sup>69</sup> As these statements represent activities over a two-year period from 1990-2011, income and expenditure data were divided by two in order to approximate yearly amounts. The audited financial statements from 2012 onwards are produced on an annual basis.

Since UNICEF's activities are not limited to the health sector, the fraction of UNICEF's expenditure that was for health was estimated using either financial data from correspondence (2001-2013 observed data was used to estimate 1990 through 2000 expenditure) or a combination of annual reports and annual results reports from 2014

through 2018. The annual results reports provide the proportion of funding for each program area and the average of 2014 through 2016 proportions was used to estimate the spending proportion for the years 1990 through 2013. In the annual results report, HIV/AIDS funding and Nutrition funding (as of 2014) was reported separately from health funding so the percentages spent on each health program were proportioned based on total spending for Health. Furthermore, UNICEF projects tracked as paid Ebola expenditure were extracted from the UNOCHA Financial Tracking System and added to estimates for UNICEF's health expenditure.

The product of observed program budget and the three-year weighted average of the DAH to budget was used to predict DAH in 2019.

#### **S3.5.4 Joint United Nations Programme on HIV/AIDS**

UNAIDS income and expenditure data for both its core and noncore budgets were extracted from its audited financial statements.<sup>67</sup> As financial data are provided on a biennial basis in all years prior to 2012, those values were divided by two to obtain yearly amounts. Dollars were deflated using the US GDP deflator specific to the reporting year.

For UNAIDS, budget measures were available only for a subset of reported total disbursements. UNAIDS reported total expenditure, which combined Unified Budget and Workplan (UBW) and non-UBW components, but only UBW budget data were available.<sup>68</sup> To predict DAH for UNAIDS in 2019, disbursements for that year were estimated by multiplying the observed UBW budget by the three-year weighted average of the ratio of DAH to the UBW budget. UNAIDS disbursements were assigned to HIV/AIDS and TB program areas as documented in Table S3.7 above.

#### **S3.5.5 UNITAID**

Data on project level disbursement was obtained through correspondence with UNITAID. Income data was extracted from the annual financial statements downloaded from UNITAID's website. The project level data provided covered project disbursements from 2007 through 2018 and project budget commitments was provided for 2019.

#### **S3.5.6 Pan American Health Organization**

The Pan American Regional Office for WHO, or PAHO, reports its income and expenditure in its biennial financial report.<sup>10,86</sup> The funds transferred through the "Rotating Fund" were excluded because developing countries fund this procurement of health commodities which are then used within that funding country, and it therefore does not fit the definition of DAH.

As the financial data are provided on a biennial basis (with the exception of 2010 through 2016, where single-year financial reports were available), the quantities were divided by two to obtain yearly amounts. Dollars were deflated using the US GDP deflator specific to the reporting year.

Correspondence with PAHO revealed that data from the financial statements include both Program and nonProgram funds. The latter include funds that countries provide PAHO, so that PAHO can reinvest these funds into the countries' national health systems. These funds should not be included as development assistance for health, and PAHO provided corrected disbursement numbers for 2008 to 2013. The corresponding disbursement numbers for 2014 and 2015 were identified in the PAHO End-of-Biennium Assessment 2014-2015. These funds were provided as biennial disbursements, so they were divided by two to obtain yearly disbursements. The ratio of Program disbursements numbers provided by PAHO and the sum of Program and non-Program funds collected from financial statements was taken for the years 2008 to 2015. The average ratio was calculated, and this ratio was multiplied

through disbursement numbers collected from financial statements from earlier years. In this way, Program and non-Program funds collected from audited statements from earlier years were adjusted to estimate DAH.

For PAHO, disbursement data were not available for 2019. PAHO provided budget information along with disbursements for 2008 to 2018. The average ratio between spending and budget was calculated over the years 2008 to 2018, and this ratio was used to estimate 2019 disbursements.

### S3.6 Tracking development assistance for health from private foundations

Previous studies on foundations outside the US have documented the severe paucity of reliable time series data and lack of comparability across countries.<sup>87</sup> Hence, this research focused efforts on tracking only US foundations.

#### S3.6.1 US Foundations

The Foundation Center maintains a database of all grants of \$10,000 or more awarded by over 1,000 US foundations. The Foundation Center has coded each grant by sector and international focus and therefore is able to identify global health grants. IHME purchased a customized dataset with cross-border health grants and health grants to US-based international programs from 1992 to 2017 from the Foundation Center.<sup>32</sup> Grants from BMGF, which were tracked separately, were excluded. Additionally, grants to channels that this research already tracks were excluded.

The Foundation Center adopted a new classification methodology as of FGH 2016. The Foundation Center was able to provide historic data based on the new classification system from 2002 to 2012. In order to obtain the series from 1992 to 2001, we multiplied a weighted fraction calculated based on both old and new classification data values from 2002 through 2004 by the old data series (1992 to 2001) we had previously obtained.

$$\begin{aligned}
 & \text{(Weighted fraction)} \\
 & = \left(\frac{1}{2}\right) (DAH_{new\ classification}) / (DAH_{old\ classification})_{2002} \\
 & + \left(\frac{1}{3}\right) (DAH_{new\ classification}) / (DAH_{old\ classification})_{2003} \\
 & + \left(\frac{1}{6}\right) (DAH_{new\ classification}) / (DAH_{old\ classification})_{2004}
 \end{aligned}$$

$$(DAH\ Estimate_t) = (Weighted\ fraction)(DAH\ Observed_t)$$

where DAH Observed is the old data values for the series 1992 through 2001

To estimate total health grants in 1990-1991 and 2017-2019, natural log of US foundation DAH was regressed on the lagged natural log of US GDP per capita and year using ordinary least squares estimation. The missing years of data were predicted based on estimated regression coefficients from the equation. Exponents of the predicted values were used as final estimates

$$(\ln\ Foundation_t) = \alpha + 1.\beta_1(\ln\ US\ GDP\ per\ capita_t) + \beta_2(year_t) + \varepsilon$$

Details on how we estimated the cost of providing technical assistance and program support for these US foundations are highlighted below in the section titled calculating the technical assistance and program support component of development assistance for health from loan-and grant-making channels of assistance.

#### S3.6.2 Bill & Melinda Gates Foundation

BMGF has been the single largest grant-making institution in the health domain since 2000; hence, additional research was undertaken to accurately capture its annual disbursements. BMGF's IRS 990PF filings for years 1999-2008, which report all global health grants disbursed per year, were downloaded from the BMGF website. Additionally, disbursement data for years 2009-2018 were collected from the BMGF online grants database, the OECD CRS and personal correspondence. The OECD CRS data was used to identify NGOs that are double-counted from other data sources.

An ordinary least squares linear regression model was used to predict the disbursement for BMGF for 2019. Since there is a strong correlation between market trends and BMGF annual disbursements, market data including lagged US GDP, lagged yearly average of Berkshire stock returns, lagged yearly average of the Russell Index, and lagged total assets of the BMGF Trust were utilized to predict the total disbursement for year 2019.

$$\begin{aligned}
 & (\text{BMGF total disbursement}_t) \\
 & = \alpha + \beta_1(\text{US GDP per capita}_{t-2}) + \beta_2(\text{Berkshire stock returns}_{t-2}) \\
 & + \beta_3(\text{Russell Index}_{t-2}) + \beta_4(\text{BMGF total asset}_{t-2}) + \varepsilon
 \end{aligned}$$

BMGF's predicted DAH was adjusted to account for in-kind DAH and double-counting. The difference between BMGF's final DAH and DAH without in-kind added and double-counting removed from 2003-2018 was regressed using ordinary least squares on DAH without in-kind added and double-counting removed and year. The predicted difference was then subtracted from the predicted DAH from the previous regression for 2019.

### S3.6.3 European Economic Area

DAH estimates for the European Economic Area were based on two downloadable project datasets available online. IHME DAH data for 2014 to 2018 was obtained from projects in the 2009-2014 grant period dataset with programme area "public health initiatives", and 2007-2012 data was obtained from projects in the 2004-2009 grant period dataset with sector "health and childcare". Childcare projects not related to health were identified and excluded based on manual screening and keyword search for the following terms: "NURSERY" "ORPHANAGE" "RECREATION" "FOSTER" " CARE HOME " " CHILDREN S HOME " " CHILD DEVELOPMENT CENTRE " " YOUTH CENTER" " YOUTH CAMPS " " RESIDENTIAL CENTRE" " RESIDENTIAL CARE FACILITIES " "CHILDCARE" " INFORMAL EDUCATION FOR CHILDREN " " PREVENT INSTITUTIONALISATION " " SPORTS FIELD" " SPORT FIELD" " SPORTS FACILIT" " SPORTS ACTIVIT" " SPORTS INFRASTRUCTURE" " REINTEGRATION OF JUVENILE OFFENDERS "

We determined that no health projects to low- and middle-income countries were implemented by the EEA prior to the 2004-2009 grant period, based on the report on the Financial Instrument 1999-2003 and the Financial Mechanism 1994-1998.<sup>88,89</sup> Project summary variables were obtained through correspondence, and were used together with project titles to assign DAH to health focus areas using a keyword search. To assign annual funding for projects that were implemented across multiple years, project grants were split based on the average daily spending across the duration of the project and the proportion of the year that the project was in implementation. The relative contributions of donors to the EEA grants (Norway, Iceland, and Liechtenstein) were obtained as constant ratios based on the 2016-2017 Annual Report.<sup>90</sup>

An open call for projects in the EEA's third grant period occurred in 2014, the first projects of which began disbursing in 2019 and are set to conclude in 2021. Data for the 2019 grants came from personal correspondence.

### S3.7 Tracking non-governmental organisations

Currently, there are no centralized, easily accessible databases for tracking program expenses of the thousands of NGOs based in high-income countries that are active in providing development assistance and humanitarian relief worldwide. This study relied on CRS data and the only comprehensive data source identified for a large subset of these NGOs, namely the United States Agency for International Development's Report of Voluntary Agencies (USAID's VolAg report).<sup>27</sup> The report, which includes both US-based and international NGOs that received funding from the US government, provides data from 1990 to 2014 on domestic and overseas expenditures for these NGOs as well as their revenue from US and other public sources, private contributions, and in-kind. Total revenue and expenditure data obtained from the NGOs' IRS tax forms, accessed through the GuideStar online database, were also used in tracking NGOs incorporated in the US.<sup>26</sup> The GuideStar Research Fundamentals Plus dataset was used to obtain information for US-based NGOs in fiscal years 2015 and 2016, including domestic, overseas, and total expenses, and revenues from all public and private sources.

First, in order to track disbursements from OECD donor countries to NGOs, we utilized channel codes present in the CRS database. The code 21000 identified international NGOs and the code 22000 identified donor-country-based NGOs. In order to remove double-counting, we conducted a keyword search on channels where the donor country was the United States to exclude NGOs present in the USAID VolAg report and the GuideStar dataset. Allocation of funding to health focus areas for NGOs tracked through the CRS was assigned as described in the section "DISAGGREGATING BY HEALTH FOCUS AREA", based on a keyword search of five descriptive variables in the CRS: project title, short description, long description, channel name, and channel reported name. For NGOs tracked in the USAID VolAg report and the GuideStar dataset, allocation of funding to health focus areas was assigned as described in the section "DISAGGREGATING BY HEALTH FOCUS AREA", based on a keyword search of the NGO's description given in the VolAg report. Due to CRS projects containing more complete descriptions than the VolAg report descriptions, the health focus area allocations from CRS were prioritized over those from the VolAg report for US NGO agencies that appeared in both sources.

In order to use the USAID VolAg data and the GuideStar dataset, several challenges were overcome. We outline these challenges here and discuss below the methods employed to estimate a consistent series of DAH channeled through NGOs despite these challenges. First, with the exception of BMGF, it was impossible to track the amount of funding from US foundations routed through US NGOs, which may have led to double-counting in estimates of total health assistance. The second challenge relates to the incompleteness of the universe of NGOs captured through the VolAg report and the GuideStar Research Fundamentals dataset. The VolAg report provides data on NGOs that received funding from the US government. While this covers many of the largest NGOs, it is not a comprehensive list. A related problem is that the VolAg report and GuideStar dataset only include NGOs that received funds in a given year. While many of the largest NGOs are consistently funded by the US government and are therefore in the dataset every year, not all NGOs are reported across all years. Third, health sector-specific expenditure is not reported in the VolAg or systematically reported in IRS tax forms. The VolAg does report overseas expenditure but does not disaggregate this expenditure by sector. Fourth, complete data are lacking in several time periods. The 2016 VolAg provided data through 2014. For NGOs incorporated in the US, IRS tax forms were obtained. Furthermore, prior to 1998 the VolAg report did not include international NGOs. Attempts were made to compile other data on the health expenditures of the top international NGOs, in terms of overseas expenditure, by searching other websites for financial documents and contacting these organizations directly. Getting reliable time series data before 2000 proved to be extremely difficult for even this small sample of international NGOs.

Estimates of the share of overseas expenditure spent on health-related projects drew upon a sample of NGOs for which such data were available. Collecting financial data on health expenditures for each NGO would have been prohibitively time-consuming. Therefore, a sample of NGOs was drawn from the list for each year; the sample included the top 30 NGOs in terms of overseas expenditure and 20 randomly selected US-based NGOs from the remaining pool, with the probability of being selected set proportional to overseas expenditure. Next, health expenditure data were collected for each NGO in this sample by seeking out annual reports, audited financial statements, 990 tax forms, and data from NGO websites. Health expenditure was carefully reviewed to ensure that

expenditures on food aid, food security, disaster relief, and water and sanitation projects were not included. Table S3.8 summarizes the number of NGOs included each year in the USAID report, the number of NGOs in the sample by year, and the number of NGOs for which health expenditure data were successfully compiled.

**Table S3.8 Summary of US non-governmental organizations in the study**

<b>Year</b>	<b>Number of US NGOs in VolAG report</b>	<b>Number of international NGOs in VolAG report</b>	<b>Number of US NGOs in IHME sample</b>	<b>Number of US NGOs from sample for which data on health expenditure were found</b>
<b>1990</b>	267	-	16	9
<b>1991</b>	334	-	19	14
<b>1992</b>	385	-	18	15
<b>1993</b>	411	-	17	12
<b>1994</b>	424	-	17	10
<b>1995</b>	416	-	16	12
<b>1996</b>	423	-	21	14
<b>1997</b>	425	-	23	18
<b>1998</b>	435	42	24	22
<b>1999</b>	438	-	33	28
<b>2000</b>	433	50	34	28
<b>2001</b>	442	51	33	26
<b>2002</b>	486	58	33	27
<b>2003</b>	507	54	42	32
<b>2004</b>	508	55	47	33
<b>2005</b>	494	59	45	36
<b>2006</b>	536	67	50	38
<b>2007</b>	556	68	50	40
<b>2008</b>	565	78	58	48

<b>2010</b>	579	94	69	57
<b>2011</b>	595	112	73	63
<b>2012</b>	579	94	69	60
<b>2013</b>	519	113	69	52
<b>2014</b>	485	106	73	54
<b>2015</b>	-	-	69	53
<b>2016</b>	-	-	136	111

A random effects regression model was fit to predict health expenditure as a fraction of total expenditure using the data for the sampled NGOs. A random effects model was chosen because the sample included observations for several NGOs for multiple years. A random effects model allows for the effect of each type of NGO to be captured distinctly. This model was used to predict the fraction of expenditure spent on health for the remaining NGOs. To ensure that the predicted health fractions were bounded between zero and one, the regression utilized the logit-transformed health fraction as the dependent variable. Since several NGOs in the sample were observed for multiple years, the regression included a random effect that varied by NGO. Five of the nine variables used to predict the

health fraction were drawn from the VolAg reports and the GuideStar dataset. They were (1) fraction of revenue from in-kind donations, (2) fraction of revenue from the US government, (3) fraction of revenue from private financial contributions, (4) overseas expenditure as a fraction of total expenditure, and (5) calendar year. The remaining four variables used to predict the health fraction were binary indicators that were constructed based on keyword searches on the NGO name and NGO description found in the VolAg. For both the NGO name and description, a keyword search was conducted to indicate whether the name or description was sufficiently health-related. Another keyword search was conducted independently on the NGO names and descriptions for keywords that indicated if the NGOs might focus on something other than health. These four indicators proved excellent predictors of health fractions.

$$\begin{aligned} \text{logit}(NGO - \text{specific } DAH_{it}) &= \alpha + \beta_1(\text{Inkind contributions fraction}_{it}) \\ &+ \beta_2(\text{US government contributions fraction}_{it}) \\ &+ \beta_3(\text{Private financial contributions fractions}_{it}) \\ &+ \beta_4(\text{Overseas expenditure as a fraction of total expenditure}_{it}) \\ &+ \beta_5(\text{Health - related name}_{it}) + \beta_6(\text{Non - health - related name}_{it}) \\ &+ \beta_7(\text{Health - related description}_{it}) + \beta_8(\text{Non - health - related description}_{it}) + U_i + \varepsilon \end{aligned}$$

Overseas health expenditure was calculated for individual NGOs in each year by multiplying the estimated health fraction and total overseas expenditure. For the NGOs that were sampled, the observed health fraction acquired through data collection was used. For the unsampled NGOs, the fitted fraction from the previously described random effects regression was used. Total overseas expenditure, reported in the VolAg, was not available for 2015-2019. For US-based NGOs, the 2016 NGO overseas fraction was calculated by regressing the logit transformed observed overseas fraction on a linear time trend using ordinary least squares, for each NGO independently. For these cases, the overseas health fraction was calculated as the product of estimated overseas fraction, estimated health fraction, and total expenditure found in the IRS 990 forms.

$$\text{logit}(\text{Observed overseas health expenditure}_i) = \alpha + \beta_i(\text{year}_t) + U_i + \varepsilon$$

At this point three reasons remained why the overseas health expenditure for some NGOs remained unknown. First, if an observation was non-US-based, then IRS tax forms were not available and total overseas expenditure could not be calculated. Second, for 2017 to 2019, no data were available. Finally, if an NGO was reported in the VolAg in multiple years but not for an intermittent year, no NGO-specific data were available for the gap year. This would be the case if an NGO received support from the US government one year and then again in a nonconsecutive year. For all three of these scenarios, a panel-based hierarchical linear regression model was used to fill in the overseas health expenditure gaps. Total overseas health expenditure (measured at the NGO-year level) was regressed on US GDP per capita and US bilateral DAH disbursed. Because the US government funds many of these NGOs, US bilateral DAH was an excellent predictor of NGO DAH. A flexible model was employed to allow both the GDP and US government DAH coefficients to vary randomly across NGOs, such that each NGO employed a unique (but not independent) relationship between overseas health expenditure, GDP, and US government DAH. A random intercept was also included to capture the significant unobserved heterogeneity present in our set of NGOs. Once fit, this model was used to predict overseas health expenditure for all remaining gaps.

$$(NGO \text{ } DAH_{it}) = \alpha + \beta_{1i}(\text{US GDP per capita}_t) + \beta_{2i}(\text{US bilateral DAH per capita}_t) + U_i + \varepsilon$$

Expenditures financed from each revenue source were then calculated by multiplying overseas health expenditure by NGO-specific revenue fractions. Expenditures from in-kind sources were deflated by a constant fraction. This was determined by comparing the federal upper limit and average wholesale price valuations of drugs on the WHO's Model List of Essential Medicines from the RED BOOK Expanded Database.<sup>28,29</sup> Figure S3.13 and Figure S3.14 show the income and estimated overseas health expenditure, respectively, of the NGOs in the universe of US- and non-US-based NGOs that were tracked in this study from 1990 to 2016 in constant 2019 US dollars.

**Figure S3.13 Total revenue received by non-governmental organizations**

The orange line shows total revenue for all sources, both public and private, received by NGOs. The green line shows estimates of private financial contributions to NGOs, while the blue line shows private in-kind donations to NGOs.

### S3.8 Tracking development assistance for health from China

The estimates of DAH contributions from China is based on data from diverse sources including government reports and international development agencies databases. We generate estimates for bilateral and multilateral contributions from China separately and aggregate to obtain the total DAH contributions from China. We use project descriptions and reports where available to determine health focus areas of the contributions. For years with limited data, we use various methods inclusive of interpolation and modeling to generate estimates.

This year we updated our estimates of DAH contributions from China by adding the China International Development Cooperation Agency (CIDCA), a new ministry of the Chinese government founded in 2018. This ministry has been tasked with taking over the international aid duties of the Chinese Ministry of Commerce (MOFCOM). To estimate contributions from this agency, we collected data on pledges and contributions from their annual budget and department final account, and conducted a literature review of their press releases to calculate a scaling proportion for the health related projects disbursed. Based on the literature review, we identified three relevant health focus areas (other health systems strengthening/sector wide approaches, other infectious diseases – Ebola, and malaria treatment) disbursed to over the two years.

Detailed description of the methods for generating the estimates are reported in Micah AE, Zhao Y, Chen CS, et al<sup>97</sup>.

### S3.9 Calculating the technical assistance and program support component of development assistance for health from loan-and grant-making channels of assistance

The following methods were used to estimate the costs incurred by loan- and grant-making institutions for administering and supporting health sector loans and grants, which includes costs related to staffing and program management.

Data on the total administrative costs were compiled for institutions in our universe for which these data were readily available: IDA, IBRD, ADB, AfDB, IDB, BMGF, the Wellcome Trust, US Foundations, CEPI, GFATM, Gavi, UNICEF, UNFPA, WHO, UNITAID, PAHO, UNAIDS, USAID, and the UK Department for International Development (DFID), Japan International Cooperation Agency (JICA), Norwegian Aid Agency (NORAD) and the Swedish International Development Agency (SIDA). The sources of data for the institutions in this sample are summarized in Table S3.9. The ratio of total administrative costs to total grants and loans was calculated for each source by year. It was assumed that the percentage of operating and administrative costs devoted to health would be equal to the percentage of grants and loans that were for health. In other words, if 20% of a foundation’s grants were for health, the model assumed that 20% of administrative costs of the foundation were spent on facilitating these health grants. Given this assumption, the ratios of the observed administrative costs to grants/loans were used to estimate the in-kind contribution made by each of these organizations toward maintaining their health grants and loans. For the institutions not in this sample, the ratio from the institution most similar to it was used to arrive at an estimate of in-kind contributions. For example, for US foundations we selected the top 10 and bottom 10 US foundations based on total disbursements across the entire time period. For each foundation, we calculated the ratio of the "cash basis" column of total operating and administrative expenses to grants paid. We then used the average of these top 10 and bottom 10 foundations ratio as the inkind ratio across time. Total in-kind contributions from all grant- and loan-making global health institutions are shown in Figure S3.14.

**Table S3.9 Summary of data sources for calculating in-kind contributions**

<b>Organization</b>	<b>Source</b>	<b>Notes</b>
<b>BMGF</b>	990 tax returns (1999-2006) BMGF Trust financial statements (2007-2018)	Used “cash basis” column to calculate ratio of total operating and administrative expenses to grants paid. Used “grants expenditure” statement to calculate ratio of administrative expenditure to grants/program expenditure.
<b>US Foundations</b>	990 tax returns	Calculated the average across time of the ratio of the “cash basis” column of total operating and administrative expenses to grants paid.
<b>Wellcome Trust</b>	Annual report	Calculated ratio of support costs to grants awarded by the trust
<b>CEPI</b>	Board of directors report, 2016-2018	Calculated ratio of operating expenses to total expenditure.
<b>GFATM</b>	Annual report financial statements	Calculated ratio of operating expenses to grants disbursed.

<b>Gavi</b>	Annual report financial statements	Calculated ratio of management, general, and fundraising expenses to program expenses.
<b>UNICEF</b>	Annual report financial statements	Calculated ratio of programme support to total expenditure (1990-2011) Calculated ratio of institutional budget to total programme and emergency budgets (2012-2018)
<b>UNFPA</b>	Annual financial review	Calculated ratio of institutional budget to total expenses
<b>WHO</b>	Financial report and annual financial statements	Calculated ratio of general operating expenses to total expenses
<b>UNITAID</b>	Financial statement	Calculated ratio of operating expenses to program expenses
<b>USAID</b>	US government budget database	Used outlays spreadsheet to calculate ratio of total outlays for USAID operating account to sum of outlays for bilateral accounts.
<b>DFID</b>	Annual report expense summary	Calculated ratio of DFID's administration expenses to DFID's bilateral program expenses from 2002 onward.
<b>JICA</b>	Statement of income in annual report	Calculated ratio of general administrative expenses to operating expenses less depreciation
<b>SIDA and other Swedish agencies disbursing aid</b>	Swedish OpenAid website <sup>91</sup>	Calculated ratio of administrative costs to the sum of all program expenses
<b>NORAD and other Norwegian agencies disbursing aid</b>	Norwegian Aid statistics website <sup>92</sup>	Calculated ratio of general administrative expenses to operating expenses less depreciation
<b>IDA</b>	World Bank audited financial statements	Calculated ratio of management fee charged by IBRD to development credit disbursements.
<b>IBRD</b>	World Bank audited financial statements	Calculated ratio of administrative expenses to loan disbursements.
<b>AfDB</b>	Income statements in annual reports	Calculated ratio of administrative expenses to the sum of loan and grant disbursements
<b>ADB</b>	Annual report	Calculated ratio of administrative expenses to the sum of loan and grant disbursements
<b>IDB</b>	Annual report and financial statement	Calculated the ratio of administrative expenses to total loan disbursements
<b>EEA</b>	Administrative budget data <sup>93</sup>	Calculated ratio of donor states' management budget and donor programme partners' participation to Net allocation to beneficiary countries

<b>PAHO</b>	Audited financial statements	Calculated ratio of general operating expenses and contractual services to total expenses.
<b>UNAIDS</b>	Audited financial statements	Calculated ratio of general operating expenses to total expenses.

**Figure S3.15 In-kind contributions by loan- and grant-making DAH channels of assistance**

This figure illustrates the proportions of financial and in-kind DAH disbursed by loan- and grant-making institutions. The proportion of in-kind DAH varies, based on the channel. The overall proportion of in-kind DAH received across all channels has grown over time.

## SECTION 4: TRACKING TOTAL SPENDING ON MALARIA BY SOURCE IN 106 COUNTRIES, 2000-2017

### S4.1 Currency Conversion

All malaria expenditure estimates were made and reported in 2019 United States dollars (USD), with the exception of Venezuela, whose expenditure was reported in 2014 USD. Data sources reported expenditure in either nominal local currency units (LCUs) or nominal USD. To convert nominal LCUs to USD, we applied deflators to nominal LCUs to inflate to 2019 LCUs. We then applied exchange rates to produce 2019 USD. When LCUs were not reported, we extracted reported expenditure in nominal USD, applied corresponding nominal exchange rates to produce nominal LCUs, inflated nominal LCUs to 2019 LCUs with deflators, and finally exchanged 2019 LCUs to 2019 USD. More information can be found in Section 2 of this appendix.

### S4.2 Spatiotemporal Gaussian process regression (ST-GPR)

We used spatiotemporal Gaussian process regression (ST-GPR) several times throughout the process of estimating malaria spending. ST-GPR generates a complete time-series of data for a set of locations, follows the data where it is available and borrows strength across time, geographic regions, and covariates' predictive power when data is not available. The interested reader may view a complete description of ST-GPR here<sup>1</sup>. Briefly, ST-GPR has three primary steps. First, a linear mixed effects model is run with a given set of predictors. Predictions from the first step provide the general trend within the data. In the second step, spatiotemporal patterns are estimated by applying a series of spatiotemporal weights to average the residuals of the first step linear model. These spatiotemporal patterns are then added to the linear predictions to generate spatiotemporally smoothed predictions. Finally, the smoothed predictions are passed as the mean function to a Gaussian process regression along with the data to produce final ST-GPR predictions. For every country-year, 1,000 draws were generated from the Gaussian process regression model and used in subsequent calculations.

### S4.3 Government health expenditure as a source on malaria

#### S4.3.1 Data

Government spending on malaria was drawn from three main sources. First, we extracted data on government spending reported by National Malaria Control Programmes (NMCPs) to the World Health Organization (WHO) and published in the WHO's annual World Malaria Reports (WMRs).<sup>2</sup> We conducted a web search of all existing National Health Accounts, including those hosted by the WHO on the Global Health Expenditure Database, and found 61 reports that estimated government expenditure as a source dedicated to malaria prevention, control, and treatment.<sup>3</sup> Finally, we extracted the government spending reported by governments submitting proposals, concept notes, and funding requests to the Global Fund. We excluded any projections for spending reported in these documents submitted to the Global Fund. Table S4.1 shows the number of countries-years available for each data source.

**Table S4.1: Main data sources for government health spending as a source for malaria**

Data source	Country-years of data
NMCP reports in the WMRs	1010
NHAs	97
Global Fund proposals, concept notes, and funding requests	466

The spending reported by NMCPs to the WMRs typically capture expenditure on prevention activities, such as insecticide-treated nets, indoor residual spraying, and chemoprevention, as well as the purchase of antimalarial drugs and diagnostics. However, they do not include spending on patient care – e.g. spending on the labor, facilities, and others costs involved in providing care to malaria patients in government health facilities outside of drugs and diagnostics. Because the government spending numbers reported in the Global Fund proposals, concept notes, and funding requests are typically submitted by the same source – NMCPs – and aligned well with the reported numbers in the WMR, we assumed that this spending also did not include patient care.

#### S4.3.2 Modeling government expenditure on malaria patient care

To estimate government spending on patient care, we built a price-volume model focused on spending on inpatient and outpatient care, respectively, as shown in (1).

$$\begin{aligned} \text{Gov}_{\text{mal patient care}} = & \quad (1) \\ & (\text{Gov cost per admission}_{\text{mal}} * \text{Public admissions}_{\text{mal}}) + \\ & (\text{Gov cost per outpatient visit}_{\text{mal}} * \text{Public outpatient visits}_{\text{mal}}) \end{aligned}$$

In (2) - (5) below, we show the equations used to estimate each element of  $\text{Gov}_{\text{mal patient care}}$ .

Estimates of Gov cost per admission<sub>mal</sub>, shown in (2), were based on country-specific average inpatient unit cost of all health conditions from Moses et al. (2018).<sup>4</sup> We extracted estimates of malaria inpatient unit costs for 17 country-years from 13 peer-reviewed articles, as shown in Table S4.2.<sup>5-17</sup> Only 8 country-years from these studies reported inpatient unit costs without spending on drugs and diagnostics. Therefore, we took the median share of non-drug, non-diagnostic spending and applied it to the remaining 11 country-years to generate mal inpatient unit cost<sub>non drug & non diagnostic</sub>. We converted these values to 2019 US dollars and took the ratio of these values to the inpatient unit costs from Moses et al. (2018) in the country and year in which the study took place. The median of this ratio (0.33) was applied to all inpatient unit costs to calculate Gov cost per admission<sub>mal</sub>.

$$\begin{aligned} \text{Gov cost per admission}_{\text{mal}} = & \quad (2) \\ & \text{inpatient unit cost} * \text{med} \left( \frac{\text{mal inpatient unit cost}_{\text{non drug \& non diagnostic}}}{\text{inpatient unit cost}} \right) \end{aligned}$$

**Table S4.2: Malaria inpatient unit costs extracted from peer-reviewed literature**

Country	Year	Inpatient unit costs (2019 USD)	Non-drug, non-diagnostic inpatient unit costs (2019 USD)	Study
Bangladesh	2003	63.26		Lubell et al. 2009
Cameroon	2013	67.61	38.24	Maka et al. 2016
China	2014	905.84	171.27	Tang et al. 2017
Democratic Republic of the Congo	2005	37.12		Tsakala et al. 2005
Ghana	2009	26.89		Sicuri et al. 2013
India	1996	28.21	18.84	Gogtay et al. 2003
India	2003	71.85		Lubell et al. 2009
Indonesia	2003	73.25		Lubell et al. 2009
Kenya	2004	163.6		Ayieko et al. 2009
Kenya	2009	31.42		Sicuri et al. 2013
Kenya	2015	92.52		Rakuomi et al. 2017
Nigeria	2009	101.09	91.23	Lubell et al. 2011
South Africa	2004	419.14		Muheki et al. 2004
Tanzania	2009	69.24	46.16	Lubell et al. 2011
Tanzania	2009	21.26		Sicuri et al. 2013
Thailand	2001	233.95	122.22	Kyaw et al. 2014
Uganda	2009	59.25	49.12	Lubell et al. 2011
Zimbabwe	2000	1881.41	1755.82	Hongoro and McPake 2003

Public admissions<sub>mal</sub>, shown in (3), represents the number of inpatient admissions for malaria in government-run health facilities. NMCP programs reported the total number of inpatient cases<sub>mal</sub> to the WHO (not disaggregated by the public and private sector but capturing admissions in both sectors) and they are published in WMRs annually. Some missingness characterizes these reported values – malaria inpatient cases were available for 29% of country-years in our sample of 106 countries. For this reason, we modeled logit-transformed malaria admissions as a share of malaria incident cases from the Global Burden of Disease (GBD) study 2017 with spatiotemporal Gaussian process regression (ST-GPR) and the following covariates: malaria Lysenko 1 from the Global Burden of Disease (GBD) study 2017,<sup>18</sup> natural log transformed ten-year lag-distributed income per capita (LDI per capita), and random effects on country, region, and super-region. We back-transformed the dependent variable and multiplied the ratio with the number of malaria incident cases to produce total malaria inpatient admissions for each of the 106 countries in our sample over 2000-2017.

$$\text{Public admissions}_{\text{mal}} = \quad (3)$$

$$\text{inpatient cases}_{\text{mal}} * \left( \frac{\text{public treated cases}_{\text{mal}}}{\text{treated cases}_{\text{mal}}} \right)$$

public treated cases<sub>mal</sub> were based on estimates of treatment-seeking in the public sector among children under five with a fever in the last two weeks, as estimated by Battle et al. (2016).<sup>19</sup> treated cases<sub>mal</sub> were from the same source but focused on all treatment-seeking among children under five with a fever in the last two weeks. These are the only comprehensive set of estimates of malaria treatment-seeking available to-date. Furthermore, treatment-seeking rates for malaria among children have been shown to be similar to treatment-seeking among adults.<sup>20,21</sup>

To impute data for countries not included in the original study, we used a similar approach to Battle et al. (2016) – we modeled logit-transformed public treatment-seeking as a share of children under five with a fever in the last two weeks with ST-GPR and the following covariates: logit-transformed, out-of-pocket (OOP) expenditure as a share of loess-smoothed total OOP health expenditure from Global Burden of Disease Health Financing Collaborator Network (2019),<sup>22</sup> log LDI per capita, coverage of the diphtheria-tetanus-pertussis vaccine, four antenatal care visits, skilled birth attendance, and random effects on country, region, and super-region. treated cases<sub>mal</sub> were imputed with a linear mixed model with fixed effects on year and year squared and random effects on region and super-region. Since both public treated cases<sub>mal</sub> and treated cases<sub>mal</sub> were modeled as a share of fever cases, we multiplied these ratios by malaria incident cases from GBD 2017 to calculate counts of each measure. We assumed that the share of total admissions in the public sector is similar to the share of all treatment seeking that occurred in the public sector and thus apply the ratio  $\frac{\text{public treated cases}_{\text{mal}}}{\text{treated cases}_{\text{mal}}}$  to inpatient cases<sub>mal</sub> to estimate Public admissions<sub>mal</sub>.

Estimating Gov cost per outpatient visit<sub>mal</sub>, shown in (4), employs a similar approach to Gov cost per admission<sub>mal</sub> in (2). Estimates of outpatient unit cost for all health conditions were sourced from Moses et al. (2018).<sup>23</sup> Malaria inpatient unit costs were extracted from 10 peer-reviewed articles.<sup>24-32</sup> Only 4 country-years additionally reported outpatient unit costs without spending on drugs and diagnostics. The median share of non-drug, non-diagnostic spending was thus applied to the remaining 6 country-years studies to generate mal outpatient unit cost<sub>non drug & non diagnostic</sub>. We converted these values to 2019 US dollars and took the ratio of these values to the outpatient unit costs from Moses et al. (2018) in the country and year in which the study took place. The median of this ratio (1.04) was applied to all outpatient unit costs to calculate Gov cost per outpatient visit<sub>mal</sub>. Table S4.3 shows each of the point estimates extracted from peer reviewed literature.

$$\text{Gov cost per outpatient visit}_{\text{mal}} = \text{outpatient unit cost} * \text{med} \left( \frac{\text{mal outpatient unit cost}_{\text{non drug \& non diagnostic}}}{\text{outpatient unit cost}} \right) \quad (4)$$

**Table S4.3: Malaria outpatient unit costs extracted from peer-reviewed literature**

Country	Year	Outpatient unit costs (2019 USD)	Non-drug, non-diagnostic outpatient unit costs (2019 USD)	Study
China	2013	1209.06		Liu et al. 2016
Ghana	2009	2.83		Sicuri et al. 2013

Estimates of Public outpatient visits<sub>mal</sub>, shown in (5), was based on Public admissions<sub>mal</sub>, estimated as in (3), and the public treated cases<sub>mal</sub> which is an input to those estimates. Public admissions<sub>mal</sub> were subtracted from public treated cases<sub>mal</sub> to calculate all outpatient visits for malaria in each country over 2000-2017.

$$\text{Public outpatient visits}_{\text{mal}} = \text{public treated cases}_{\text{mal}} - \text{Public admissions}_{\text{mal}} \quad (5)$$

#### S4.3.3 Modeling total government expenditure on malaria

Total government spending is the sum of Gov<sub>mal patient care</sub> as described above and the government spending from the NMCP programs, as reported in WMRs and Global Fund proposals, concept notes, and funding requests (NMCP Gov<sub>mal</sub>), appended by the government spending on malaria estimated in NHAs (NHA Gov<sub>mal</sub>), as shown in (6).

$$\begin{aligned} \text{Gov total}_{\text{mal}} &= \text{NMCP Gov}_{\text{mal}} + \text{Gov}_{\text{mal patient care}} \quad (6) \\ &= \text{NHA Gov}_{\text{mal}} \end{aligned}$$

To estimate a full time series for all years and countries in our study, we modelled Gov total<sub>mal</sub> as a logit transformed fraction of loess smoothed, total government health spending using ST-GPR. We first considered the following covariates: malaria incidence, malaria prevalence, LDI per capita, coverage of indoor residual spraying (IRS), insecticide-treated nets (ITNs), malaria Lysenko 1, one- and four-visit antenatal care coverage, ACT coverage, the healthcare access and quality index (HAQI), the proportion of the population living in an urban area, coverage of skilled birth attendance (SBA), the sociodemographic index (SDI) and the universal health coverage (UHC) index. All the covariates measured as

a proportion were logit-transformed. We sourced all covariate estimates from the GBD Study 2017 and the Malaria Atlas Project.

Because the availability of covariate data is higher for sub-Saharan Africa and patterns of incidence and intervention strategies differ from other regions, we split the government malaria spending data into two groups – sub-Saharan African and non-sub-Saharan African countries – and modeled each group separately. We performed covariate selection for each dataset, starting with the set of 14 potential covariates.

We first conducted a lasso regression to determine which covariates were least correlated, conditional on other covariates, with the fraction of government spending on malaria as the dependent variable. Covariates with an estimated coefficient of zero were removed from the set of possible covariates. We then used linear mixed effects regression to estimate all models including all possible combinations of the remaining covariates. We then selected the intersection of 1000 best models with the lowest Akaike information criterion (AIC) and Bayesian information criterion (BIC) values. Finally, we completed a 10-fold cross-validation with out-of-sample predictions on these selected 1000 models. We selected the best model based on out-of-sample root mean squared error. The top-five models are shown in Table S4.4. Our final model is model 1 in both SSA and non-SSA sections.

**Table S4.4: Top government spending models based on out-of-sample root-mean square error**

<b>SSA</b>	<b>Covariates</b>	<b>OOS RMSE</b>
1	Insecticide-treated nets (ITNs), Coverage of indoor residual spraying (IRS), One visit antenatal care coverage, Coverage of skilled birth attendance (SBA), Malaria prevalence	1.539028
2	Insecticide-treated nets (ITNs), Coverage of indoor residual spraying (IRS), One visit antenatal care coverage, Coverage of skilled birth attendance (SBA), Malaria incidence	1.539187
3	Insecticide-treated nets (ITNs), Coverage of indoor residual spraying (IRS), One visit antenatal care coverage, Healthcare access and quality index (HAQI), Malaria prevalence	1.539274
4	Insecticide-treated nets (ITNs), One visit antenatal care coverage, Coverage of skilled birth attendance (SBA), Malaria prevalence	1.539577
5	Insecticide-treated nets (ITNs), Coverage of indoor residual spraying (IRS), One visit antenatal care coverage, Proportion of the population living in an urban area, Malaria incidence	1.539592
<b>Non - SSA</b>	<b>Covariates</b>	<b>OOS RMSE</b>
1	Coverage of indoor residual spraying (IRS), Malaria Lysenko 1, Proportion of the population living in an urban area, Coverage of skilled birth attendance (SBA), Malaria incidence, Malaria prevalence, Lag distributed income (LDI) per capita	0.800753

2	Coverage of indoor residual spraying (IRS), Proportion of the population living in an urban area, Coverage of skilled birth attendance (SBA), Malaria incidence, Malaria prevalence, Lag distributed income (LDI) per capita	0.800794
3	Malaria Lysenko 1, Proportion of the population living in an urban area, Coverage of skilled birth attendance (SBA), Malaria incidence, Malaria prevalence, Lag distributed income (LDI) per capita	0.801354
4	Proportion of the population living in an urban area, Coverage of skilled birth attendance (SBA), Malaria incidence, Malaria prevalence, Lag distributed income (LDI) per capita	0.801478
5	Coverage of indoor residual spraying (IRS), Malaria Lysenko 1, Coverage of skilled birth attendance (SBA), Malaria incidence, Malaria prevalence, Lag distributed income (LDI) per capita	0.801484

Finally, we used a spatiotemporal Gaussian process regression (ST-GPR) to model government spending on malaria, independently modeling sub-Saharan African countries and non-sub-Saharan African countries. The first stage of ST-GPR was a mixed-effect model with random effects on Global Burden of Disease region and country, as well as the covariates selected using the method described above. To detect and reduce the influence of outlier data points, we used the selected model to measure Cooke's distance for each data point. We excluded each data point if Cooke's distance was greater than  $4/n$  where  $n$  is the total number of Gov total<sub>mal</sub> data points. Additionally, we removed several data points by visual inspection; these are listed in table S4.5 below.

**Table S4.5: Malaria GHE data points removed by visual inspection**

Country	Year	Source Type	Value (2019 USD)

#### S4.4 Out-of-pocket spending on malaria

##### S4.4.1 Price-volume model

We found only 83 points of malaria OOP expenditure, all sourced from NHAs. To augment this sparse dataset, we developed a price-volume model of malaria OOP, focused on the OOP costs of malaria treatment. Because of the substantial investment of governments and donors into malaria prevention and

control, including financing of insecticide-treated nets, indoor residual spraying, community outreach and chemoprevention,<sup>33</sup> we assumed that the OOP spending on prevention is minimal, and focused on estimating the OOP spending on malaria treatment. Our price-volume model is shown in (7). The estimation strategy for each component of (7) is described in (8)-(12).

$$\begin{aligned} \text{OOP}_{\text{mal}} = & \hspace{15em} (7) \\ & (\text{OOP cost per admission}_{\text{mal}} * \text{Admissions}_{\text{mal}}) + \\ & (\text{OOP cost per outpatient visit}_{\text{mal}} * \text{Outpatient visits}_{\text{mal}}) + \\ & \text{OOP drug expenditure}_{\text{mal}} \end{aligned}$$

The approach to estimating volume of malaria treatment-seeking, both  $\text{Admissions}_{\text{mal}}$  and  $\text{Outpatient visits}_{\text{mal}}$ , are described above. Inpatient cases were sourced from the WHO's WMRs and were modeled as share of all inpatient stays with ST-GPR. Outpatient visits  $\text{mal}$  are treated cases $\text{mal}$ , or treatment-seeking among children under five with a fever in the last two weeks based on Battle et al. (2016), minus  $\text{Admissions}_{\text{mal}}$ .

OOP cost per admission $\text{mal}$ , as shown in (8), was estimated similarly to Gov cost per admission $\text{mal}$ , with some modifications. Moses et al. (2018) was the source of inpatient unit cost. We adjusted these country-specific values to reflect the share of unit costs sourced OOP using the fraction  $\frac{\text{OOP inpatient spend}}{\text{Total inpatient spend}}$ , calculated using 625 country-years of extracted NHA data.  $\frac{\text{OOP inpatient spend}}{\text{Total inpatient spend}}$  was logit-transformed and modeled with ST-GPR with the following covariates: logit-transformed OOP/THE from the Global Burden of Disease Financing Global Health Collaborator Network (2019), natural log-transformed LDI per capita and country, region, and super-region effects. Estimates of OOP spending on malaria admissions (mal OOP inpatient unit cost) were extracted from nine peer-reviewed articles,<sup>34-42</sup> shown in Table S4.6, and converted to 2019 US dollars. To adjust average OOP inpatient unit costs to represent OOP costs per inpatient stay, we computed the median of the ratio  $\frac{\text{mal OOP inpatient unit cost}}{\left(\text{inpatient unit cost} * \frac{\text{OOP inpatient spend}}{\text{Total inpatient spend}}\right)}$ , which amounted to 0.32, and applied it to all other estimates of inpatient unit cost \*  $\frac{\text{OOP inpatient spend}}{\text{Total inpatient spend}}$  to generate OOP cost per admission $\text{mal}$ .

$$\begin{aligned} \text{OOP cost per admission}_{\text{mal}} = & \hspace{15em} (8) \\ & \text{inpatient unit cost} * \frac{\text{OOP inpatient spend}}{\text{Total inpatient spend}} * \text{med} \left( \frac{\text{mal OOP inpatient unit cost}}{\left(\text{inpatient unit cost} * \frac{\text{OOP inpatient spend}}{\text{Total inpatient spend}}\right)} \right) \end{aligned}$$

**Table S4.6: Malaria OOP inpatient unit costs extracted from peer-reviewed literature**

Estimating OOP cost per outpatient visit<sub>mal</sub> employed a similar approach to strategy applied in (8). We used outpatient unit cost from Moses et al. (2018) and adjusted those country-specific estimates to reflect the OOP unit costs of outpatient spending by applying the fraction of outpatient spending sourced OOP:  $\left(\frac{\text{OOP outpatient spend}}{\text{Total outpatient spend}}\right)$ . This fraction was calculated with 625 country-years of extracted NHA and modeled with ST-GPR. As covariates, we used logit-transformed OOP/THE, log LDI per capita and random effects on country, region and super region. As shown in Table S4.7, we extracted 13 country-years of data from 10 peer-reviewed articles to create mal OOP outpatient unit cost<sub>non drug</sub>.<sup>43-54</sup> To adjust average OOP outpatient unit costs to represent malaria OOP non-drug unit costs, we computed the median of the ratio  $\frac{\text{mal OOP outpatient unit cost}_{\text{non drug}}}{\left(\text{outpatient unit cost} * \frac{\text{OOP outpatient spend}}{\text{Total outpatient spend}}\right)}$ , which amounted to 0.37, and applied it to all other estimates of outpatient unit cost \*  $\frac{\text{OOP outpatient spend}}{\text{Total outpatient spend}}$  to generate OOP cost per outpatient visit<sub>mal</sub>.

$$\text{OOP cost per outpatient visit}_{\text{mal}} = \text{outpatient unit cost} * \frac{\text{OOP outpatient spend}}{\text{Total outpatient spend}} * \text{med} \left( \frac{\text{mal OOP outpatient unit cost}_{\text{non drug}}}{\left(\text{outpatient unit cost} * \frac{\text{OOP outpatient spend}}{\text{Total outpatient spend}}\right)} \right) \quad (9)$$

**Table S4.7: Malaria OOP non-drug outpatient unit costs extracted from peer-reviewed literature**

Uganda	2012	0.04	Matovu et al. 2014
Vietnam	2004	1.14	Morel et al. 2008

We modeled drug expenditure on malaria broken down by spending on ACTs, which tend to be higher and have a different trend over 2000-2017, separately from other antimalarials, which included monotherapies, chloroquine, and other antimalarials, as shown in (10).

$$\begin{aligned} \text{OOP drug expenditure}_{\text{mal}} = & \hspace{15em} (10) \\ & \text{ACT price} * \text{ACT covered cases} + \\ & \text{Other antimalarial price} * \text{Other antimalarial covered cases} \end{aligned}$$

Data on OOP spending on ACTs and other antimalarials were sourced from reports on the outlet surveys conducted by ACTwatch (169),<sup>55</sup> Health Action International (738),<sup>56</sup> and as reported in a report by the Affordable Medicines Facility – malaria (AMFm).<sup>57</sup> The outlet surveys captured the price charged to patients for an array of malaria drugs as well as their availability in private and public drug outlets, including government-run health facilities. For each outlet survey country-year, we took the average across the different ACTs and other antimalarials, respectively, weighted by their availability in different outlet types to approximate access to public and private OOP prices of drugs. All OOP drug prices were converted to 2019 USD. We modeled ACT and other antimalarial OOP prices separately. Since 2000, the average cost of an antimalarial treatment course has decreased substantially,<sup>58</sup> influenced by negotiations to lower prices by AMF-m and the Global Fund. Furthermore, since 2000, many countries

have instituted policies to provide ACTs free-of-charge in the public sector. Therefore, we modeled a country-specific trend for ACTs, incorporating changes to ACT-free policies.

Our main covariate for modeling OOP drug prices was the public procurement price of ACTs, sourced from the WHO’s Global Price Reporting Mechanism (GPRM),<sup>59</sup> and the Global Fund’s Price and Quality Reporting database,<sup>60</sup> which capture ACTs procured by NMCPs, non-governmental organizations and other institutions that received grants from the Global Fund or participate in the GPRM. For each country-year, we took the average procurement price paid for ACTs, weighted by the volume of drugs purchased, and converted all prices to 2019 US dollars. A full time series of ACT procurement prices was modeled with ST-GPR with log-transformed average global price of an ACT treatment course from Management Sciences for Health,<sup>61</sup> and random effects on country, region and super region. We log-transformed OOP ACT price, and applied a robust regression to log-transformed ACT procurement price and an indicator for whether not a ACTs were provided free in the public sector in that country-year as reported in the WHO’s WMRs.

Average prices for other antimalarials have not changes substantially in real terms since 2000.<sup>62</sup> However, we wanted to capture regional and country variation in antimalarial OOP drug prices. We therefore modeled log-transformed other antimalarial OOP price with random effects on country, region and super-region with a linear mixed effects model.

The equations used for ACT covered cases and other antimalarial covered cases are shown in (11) and (12). We assumed that all treated cases for malaria received some sort of antimalarial drug. We relied on estimates of ACT coverage among children under five with a fever in the last two weeks estimated by the Bennett et al. (2017).<sup>63</sup> These data did not cover countries outside of sub-Saharan Africa, however, and so we imputed ACT coverage for these countries by replicating the same approach employed by Bennet et al. (2017). We extracted the ACTs delivered for each country, as reported in the WHO’s WMR. To fill in missing values in this dataset, we modeled log ACTs delivered per incident case in ST-GPR, with log LDI per capita as the sole covariate and random effects on country, region and super-region. Finally, logit-transformed ACT coverage was modeled with ST-GPR with log ACTs per capita and log LDI per capita and random effects on country, region, and super region. We multiplied ACT coverage and incidence cases to calculate ACT treated cases. We assume that all treated cases that did not get an ACT received another antimalarial. As described in the government spending section, treated cases<sub>mal</sub> were based on Battle et al. (2016) and inpatient cases<sub>mal</sub> were modeled based on the inpatient cases reported in the WHO’s WMRs. We subtracted inpatient cases<sub>mal</sub> from treated cases<sub>mal</sub> to focus on non-inpatient treatment seeking.

$$\begin{aligned} \text{ACT covered cases} &= & (11) \\ (\text{treated cases}_{\text{mal}} - \text{inpatient cases}_{\text{mal}}) * \frac{\text{ACT treated cases}}{\text{treated cases}_{\text{mal}}} \end{aligned}$$

$$\begin{aligned} \text{Other antimalarial covered cases} &= & (12) \\ (\text{treated cases}_{\text{mal}} - \text{inpatient cases}_{\text{mal}}) * \left(1 - \frac{\text{ACT treated cases}}{\text{treated cases}_{\text{mal}}}\right) \end{aligned}$$

#### S4.4.2 Modeling total out-of-pocket expenditure on malaria

We appended  $OOP_{mal}$  from the price-volume model to the 81 NHA points to create the full malaria OOP dataset. Using these data, we used ST-GPR to model logit-transformed OOP spending on malaria as a share of total loess-smoothed OOP spending excluding OOP spending on HIV. Because the availability of covariate data is higher for sub-Saharan Africa and patterns of incidence and intervention strategies differ from other regions, we split the OOP malaria spending data into two groups – sub-Saharan African and non-sub-Saharan African countries – and modeled each group separately. Both models included the following covariates: LDI per capita and malaria incidence per capita, with random effects for country, region, and super-region. The sub-Saharan Africa model additionally included coverage of indoor residual spraying (IRS) and insecticide-treated nets (ITNs). To detect and reduce the influence of outlier data points, we used the selected model to measure Cooke's distance for each data point; outliers were detected at the country level, with an individual model run for each location, without the geographic random effects. We excluded data points whose Cooke's distance was greater than  $4/n$  where  $n$  is the total number of OOP data points for each country.

#### S4.4.3 Excluding data from an NHA from Nigeria

As described above, after generating cost-volume estimates of OOP spending on malaria, we appended these estimates to any data on malaria OOP spending extracted from NHAs and ran ST-GPR on the combined dataset to generate a complete series. In the past, the NHA and cost-volume data have not diverged to the extent that they caused concern. However, this year, new data from a Nigerian NHA was so different from our cost-volume estimates and so much substantially larger than most other estimates of malaria OOP spending that it prompted additional investigations, which led us to exclude this NHA's data from our OOP model.

In order to determine whether to include data on malaria OOP spending from this NHA, we compared the NHA's data and our cost\*volume estimates to our estimates of malaria OOP spending for 16 similar countries. In order to determine a list of similar countries, we used k-means clustering to group all 106 malaria endemic countries in terms of malaria incidence per capita, lag-distributed income per capita, and the fraction of total health sector spending that is OOP. The number of clusters (7) was determined based on the elbow of a scree-plot. The countries in Nigeria's cluster are shown below in Table S4.8. Once this group of 16 comparison countries was determined, we compared the cost-volume and NHA data on Nigeria's OOP malaria spending to the minimum, maximum, and mean values of OOP spending across the 16 other countries in Nigeria's cluster. Results are displayed in Table S4.9.

**Table S4.8: List of countries in Nigeria's cluster**

Countries in Nigeria's Cluster
Benin
Burkina Faso
Cameroon
Central African Republic
Chad
Congo
Cote d'Ivoire

Democratic Republic of the Congo
Ghana
Guinea
Liberia
Mali
Niger
Sierra Leone
Togo
Uganda

As shown below in Table S4.9, the NHA’s reported spending per capita, per prevalent case, and per incident case are each about 10 times the maximum value of the cluster, while the cost-volume estimates are close to the mean values from the cluster. In comparison, although this is not shown below, Nigeria’s government spending on malaria per capita, per incident case, and per prevalent case are very near the mean of this cluster. We believe this is strong evidence that the OOP malaria spending data from the recent Nigerian NHA is too high, and that the cost-volume estimates are well within reason.

**Table S4.9: Results from clustering analysis**

	Nigeria cost volume	Nigeria NHA	Comparator country min	Comparator country mean	Comparator country max
Malaria OOP per capita	0.97	25.64	0.27	1.21	2.82
Malaria OOP per health sector OOP	0.02	0.44	0.02	0.06	0.14
Malaria OOP per prevalent case	6.96	184.51	1.18	6.66	17.81
Malaria OOP per incident case	4.41	116.77	1.05	4.61	12.12

In addition to comparing the NHA and cost\*volume estimates for Nigeria against malaria OOP estimates from comparator countries, we also identified seven articles on household spending on malaria in Nigeria and compared the estimates presented in these studies to data from the NHA and our cost-volume estimates. This comparison provided further evidence that the Nigerian NHA’s data on OOP malaria spending was implausibly high. The studies we reviewed can be found in Table S4.10, below.

**Table S4.10: Reviewed literature on Malaria OOP spending**

#### S4.5 Prepaid private spending on malaria

Just 50 country-years of NHA data included prepaid private (PPP) expenditure on malaria. We combined these data with the estimates outlined above for OOP and government spending on malaria and malaria-focused development assistance for health (DAH) data from the Institute for Health Metrics and Evaluation to calculate total spending on malaria.<sup>64</sup> As a share of total spending on malaria, median PPP from the 50 NHA country-years was 0.8%. We computed the median ratio of malaria PPP share of non-PPP malaria spending to total loess-smoothed PPP over loess-smoothed non-PPP all health spending, as shown in (13), to calculate  $\rho$  (0.47).

$$\rho = \text{med} \left[ \frac{\left( \frac{\text{PPP}_{\text{mal}}}{\text{DAH}_{\text{mal}} + \text{GHES}_{\text{mal}} + \text{OOP}_{\text{mal}}} \right)}{\left( \frac{\text{PPP}}{\text{DAH} + \text{GHES} + \text{OOP}} \right)} \right] \quad (13)$$

In order to estimate PPP spending on malaria, we re-arranged terms and applied  $\rho$  to the estimated  $\text{DAH}_{\text{mal}} + \text{GHES}_{\text{mal}} + \text{OOP}_{\text{mal}}$  and total health terms, as shown in (14).

$$\text{PPP}_{\text{mal}} = \rho * \left( \frac{\text{PPP}}{\text{DAH} + \text{GHES} + \text{OOP}} \right) * (\text{DAH}_{\text{mal}} + \text{GHES}_{\text{mal}} + \text{OOP}_{\text{mal}}) \quad (14)$$

#### S.4.6 Malaria elimination status of the 106 countries

## SECTION 5. TRACKING POTENTIAL FOR ADDITIONAL GOVERNMENT SPENDING ON HIV/AIDS IN 135 LOW- AND MIDDLE-INCOME COUNTRIES, 2000 THROUGH 2017

### S5.1 Acronyms and abbreviations

**BIC**, Bayesian information criteria

**DAH-HIV/AIDS**, Development assistance for health for HIV/AIDS

**GAM**, Global AIDS Monitoring

**GARPR**, Global Aids Response Progress Reports

**HAQI**, Healthcare access and quality index

**HIV/AIDS**, Human immunodeficiency virus, acquired immunodeficiency syndrome

**LCU**, Local currency units

**LDI**, 10-year lag distributed GDP per capita

**NASAs**, National AIDS Spending Assessments

**NHA**, National Health Accounts

**PPP**, Purchasing price parity

**ST-GPR**, Spatiotemporal Gaussian Process Regression

**THE**, Total health expenditure

**UNAIDS**, the Joint United Nations Programme on HIV/AIDS

**USD**, United states dollar

### S5.2 Overview

In this study, we were interested in extracting data providing information on HIV/AIDS spending at the country-level by domestic financing source (domestic, government, private, prepaid private and out-of-pocket (OOP)) and domestic spending by spending category (care and treatment, prevention, and other). We extracted publicly available data from websites of international institutions and government data aggregators. HIV/AIDS spending data were extracted from seven sources:

- AIDSinfo database published by the Joint United Nations Programme on HIV/AIDS (UNAIDS)
- UNAIDS Global Aids Response Progress Reports (GARPR)
- UNAIDS health financing dashboard database (includes data from GARPR and Global Aids Monitoring (GAM))
- Government and private spending data reported by countries in proposals, concept notes, and funding requests submitted to the Global Fund to Fight AIDS, Tuberculosis and Malaria (the Global Fund)
- National Health Accounts that capture HIV/AIDS spending, including sub-accounts and accounts that adhere to the System of Health Accounts 2011 (SHA 2011) methodology
- National AIDS Spending Assessments (NASAs)
- Asia Pacific region data downloaded from the AIDS data hub

We leveraged the unique strengths across the different datasets, with the understanding that they were all generated to serve different purposes. The financing data collated by UNAIDS is sourced from annual reporting by countries to UNAIDS, in line with the 2000 Declaration on Commitment to HIV/AIDS.

Similarly, countries report domestic spending in proposals, concept notes, and funding requests submitted to the Global Fund to secure funding. The Global Fund requires countries submit these estimates as part of a requirement that they contribute funds to the disease area of focus, in addition to Global Fund contributions. Staff at both the Global Fund and UNAIDS verify the data submitted to them, but in general do not publish data that has been altered from what countries themselves report.

Not all extracted data sources used the same definition of health expenditures. For example, National AIDS Spending Assessment's (NASAs) definition of health expenditure on HIV/AIDS followed a broader definition than the definition of health expenditure provided by National Health Accounts (NHAs). Specifically, NASAs included expenditure on non-health spending categories such as orphans and vulnerable children, creation of an enabling environment, and other social protection services.

To harmonize the definition of HIV/AIDS related health expenditure amongst data sources, when provided, we subtracted expenditure related to orphans and vulnerable children, creation of an enabling environment, and social protection services, from the respective sources and functions of health expenditure reported in the NASAs. The three spending categories of orphans and vulnerable children, creation of an enabling environment, and social protection do not represent an exhaustive list of the deviations between NASAs and NHAs' HIV/AIDS spending definition, but do represent the vast majority of this deviation. Other spending categories that were included in NASAs but not included in NHAs were more granular and frequently not reported. Finally, in inspecting some of our data, we noticed the presence of duplicates. This was because many of our data sources drew from the same underlying data (AIDSinfo, UNAIDS' health financing dashboard, NASAs, GARPR). If multiple sources reported the same spending value for the same country, year, and financing source or health function, we removed all but one of these data points.

We extracted a total of 8,065 unique data points from 2000 to 2017. Data for government health spending on HIV/AIDS was most substantial, with more than 2,900 data points. Data was most sparse for out-of-pocket, prepaid private, and other domestic health function spending, for which there were 239, 280, and 329 data points, respectively. Table S5.1 provides breakdowns of the number of data points by year and quantity of interest.

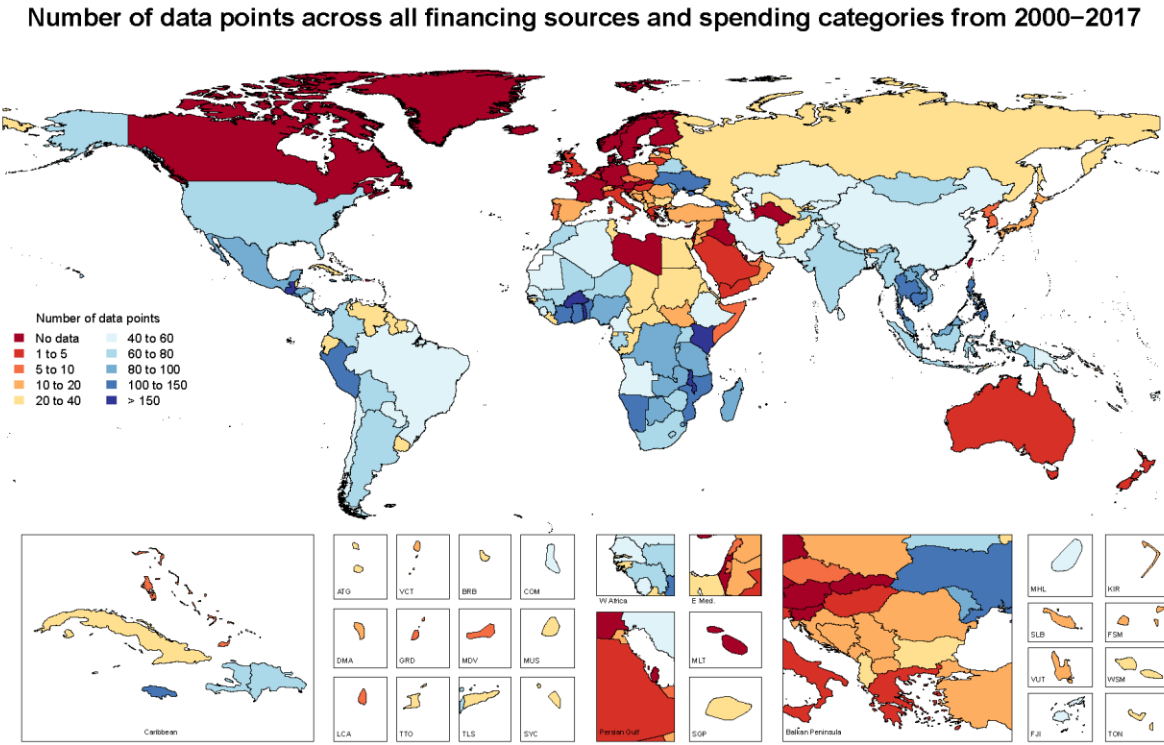

Figure S5.1 captures the availability of HIV/AIDS spending data by country. Data density was highest in low- and middle-income countries with a large HIV/AIDS burden, notably Southern and Eastern sub-Saharan Africa; high-income countries had the fewest data points.

**Table S5.1: Number of data points by year and prediction unit**

Year	Domestic spending	Private spending	Out-of-pocket spending	Prepaid private spending	Government spending	Domestic other spending	Domestic care and treatment spending	Domestic prevention spending
2000	7	6	6	4	13	3	10	10
2001	24	7	2	2	14	2	9	9
2002	25	11	8	7	18	6	15	15
2003	26	10	3	3	19	5	9	11
2004	45	13	5	5	50	5	13	13
2005	57	34	10	13	101	12	30	32
2006	63	55	15	17	182	17	44	47
2007	57	68	16	22	233	16	59	59

2008	68	117	22	28	295	22	105	102
2009	68	124	21	25	289	27	115	117
2010	73	122	22	25	258	28	96	100
2011	60	105	17	22	211	22	77	75
2012	105	169	28	32	291	25	65	66
2013	115	133	20	21	259	20	62	61
2014	118	115	15	23	223	24	51	56
2015	101	101	13	14	226	35	50	49
2016	45	63	8	9	160	29	61	52
2017	20	56	8	8	132	31	55	57

**Figure S5.1: Map of HIV/AIDS data availability**

While the analysis presents on only domestic and government spending on HIV/AIDS in 135 low- and middle-income countries, we used data from high-income countries to inform and improve the overall fit of the models.

**S5.3 Removing non-HIV focused spending from GARPR/GAM datasets**

The most recent UNAIDS health financing dashboard dataset, which includes data from 2011-2018 from a number of GARPR and GAM reports, provided a detailed disaggregation of HIV and AIDS spending by health function (spending programme) and financing source. This allowed us to remove non-health spending from our estimates of total health spending on HIV and refine the definition of government spending on HIV. The spending we removed is on allied sectors, but does not meet the definition of

health spending defined by the System of Health Accounts. We removed spending on gender programmes, programmes for children and adolescents, social protection, synergies with development sectors, and tuberculosis from our estimates of total HIV spending. Furthermore, we removed spending sourced from reimbursable development bank loans from our estimates of total government spending on HIV. The specific mapping of GARPR/GAM HIV and AIDS programmes to our health function categories is presented below in Table S5.2.

We also used this dataset, which includes the disaggregation to these granular health programs, to adjust previously published GARPR/GAM datasets which did not include this level of detail. This process allowed us to remove what we expect to be the proportion of non-health spending and development bank loans from older, more aggregated GARPR/GAM datasets. We first calculated the fraction of health spending relative to total spending captured in the GARPR/GAM database using the granular data from the newest dataset. We calculated this ratio for each health function and financing source category, and then applied this ratio to older GARPR/GAM data which did not include this level of detail, using the country-level ratio when possible. When a country-level ratio was not available, we used the average ratio by health function and financing source. On average, this resulted in a 5% reduction of the previous GARPR/GAM database estimates. The main limitation of this approach is that we assume that the cross-year average proportion of non-health spending for each country and spending component is consistent between the new and old GARPR/GAM databases.

**Table S5.2: Mapping GARPR and GAM spending programmes to health function categories**

<b>HIV and AIDS Programme</b>	<b>Health Function</b>
1 Treatment, care and support	Curative Care
2 Prevention of vertical transmission of HIV (sub total)	Prevention
3 Prevention	Prevention
4 Gender programmes	Not included
5 Programmes for children and adolescents	Not included
6 Social protection	Not included
7 Community mobilization	Other health function
8 Governance and sustainability	Other health function
9 Critical enablers	Other health function
10 TB / HIV co infection, diagnosis and treatment (sub total)	Not included
1. Prevention of sexual transmission of HIV	Prevention
2. HIV prevention for people who inject drugs	Prevention
3. Prevention of mother to child transmission	Prevention
4. Universal access to treatment	Curative Care
5. TB	Not included
6. Governance and sustainability	Other health function
7. Critical enablers	Other health function
8. Synergies with development sectors	Not included

---

## S5.4 Currency conversion

All HIV/AIDS expenditure estimates are presented in 2019 United States dollars), with the exception of Venezuela, whose expenditure was reported in 2014 USD. Data sources reported spending in either nominal local currency units (LCUs) or nominal United States Dollars (USD). To convert nominal LCUs to United States dollars, we applied deflators to nominal LCU to inflate to 2019 LCUs. We then applied exchange rates to produce 2019 United States dollars. When LCUs were not reported, we extracted reported expenditure in nominal USD, applied corresponding nominal exchange rates to produce nominal LCUs, inflated nominal LCUs to 2019 LCUs with deflators, and finally exchanged 2019 LCUs to 2019 United States dollars. More information can be found in Section 2 of this appendix.

## S5.5 Modeling HIV/AIDS Spending with ST-GPR

As previously mentioned in the manuscript, we used spatiotemporal Gaussian process regression (ST-GPR) to model HIV/AIDS spending for five financing source models (domestic, private, government, prepaid private, and OOP) and three domestic spending category models (prevention, care and treatment, and other). ST-GPR generates a complete time-series of data for a set of locations, follows the data where it is available and borrows strength across time, geographic regions, and covariates' predictive power when data is not available. The interested reader may view a complete description of ST-GPR here<sup>7</sup>. ST-GPR has three primary steps. First, a linear mixed effects model is run with a given set of predictors. Predictions from the first step provide the general trend within the data. In the second step, spatiotemporal patterns are estimated by applying a series of spatiotemporal weights to average the residuals of the first step linear model. These spatiotemporal patterns are then added to the linear predictions to generate spatiotemporally smoothed predictions. Finally, the smoothed predictions are passed as the mean function to a Gaussian process regression along with the data to produce final ST-GPR predictions. For every country-year, 1,000 draws were generated from the Gaussian process regression model and used in subsequent calculations.

For the first step of ST-GPR—the linear model—we used a linear mixed effects regression with random effects on Global burden of disease (GBD) super region and GBD region. The exact set of fixed-effect covariates for each model is presented in Table S5.3. All covariates were sourced from GBD 2017<sup>8,9</sup>. Within the linear model step, we measured each data point's cook's distance, and after checking to ensure the data was properly extracted, we excluded every data point with a cook's distance exceeding  $4/n$ , where  $n$  is the total number of data points within the model. Additionally, we removed several data points by visual inspection; these are listed in Table S5.4 below.

**Table S5.3: Covariates used in ST-GPR**

<b>ST-GPR model</b>	<b>Covariates</b>
Domestic	Lag distributed income per capita, ART price, HIV/AIDS prevalence
Government	Lag distributed income per capita, ART price, HIV prevalence
Private	Lag distributed income per capita, HIV/AIDS prevalence
OOP	Lag distributed income per capita, HIV/AIDS prevalence

Prepaid private	Lag distributed income per capita, ART price, HIV prevalence
Domestic HIV/AIDS spending on care and treatment	Lag distributed income per capita, ART price, HIV/AIDS prevalence
Domestic HIV/AIDS spending on prevention	Lag distributed income per capita, ART price, HIV/AIDS prevalence
Domestic HIV/AIDS spending on all other functions	Lag distributed income per capita, ART price, HIV/AIDS prevalence

**Table S5.4: HIV data points removed by visual inspection**

Country	Year	Component	Source Type	Value (2019 USD)
Comoros	2011	Government Spending	UNAIDS health financing dashboard database	821,723.40
The Gambia	2014	Government Spending	UNAIDS health financing dashboard database	4,107,382.70
The Gambia	2014	Government Spending	AIDSinfo database	4,107,382.30
Cote d'Ivoire	2009	Private Spending	National Health Account	18,864,402.10
Cote d'Ivoire	2010	Private Spending	National Health Account	20,271,147.20
Guinea	2013	Private Spending	National Health Account	13,430,795.40

### S5.6 Enforcing internal consistency

To ensure internal consistency between the HIV/AIDS spending estimates and the all health spending estimates<sup>6</sup>, HIV/AIDS spending by source was modeled as the logit transformed fraction of the respective, loess smoothed, all health spending by financing source estimate (e.g. domestic HIV/AIDS spending divided by all domestic health spending). As a consistency check, extracted data points were outliered if the fraction of HIV/AIDS spending by source and all health spending by source exceeded one.

While the above transformation helped ensure internal consistency between HIV/AIDS spending and all health spending, we were still required to ensure internal consistency within our estimates such that government HIV/AIDS spending did not exceed domestic HIV/AIDS spending, and further we wished to take advantage of all the extracted data within the implemented models. These objectives were accomplished by both aggregating and raking. Aggregating is the process of summing mutually exclusive and collectively exhaustive estimates of sub-components of health expenditure (e.g. OOP, prepaid private, government spending, development assistance) and using the sum as the estimate of total health expenditure. Raking is the exact opposite of aggregating. In raking, we used estimates of total health expenditure to evenly scale the estimated sub-components to ensure the sub-components sum to the estimated total health expenditure. Raking and aggregating are equally valid and widely used in health financing and in the Global Burden of Disease<sup>8,9</sup>.

In our extracted dataset, few data sources (NHAs and NASAs) reported OOP, prepaid private, or total HIV/AIDS spending (sum of OOP, prepaid private, government, DAH-HIV/AIDS), while nearly all data sources reported expenditure of either government, private (sum of OOP and prepaid private, but not disaggregated), and total domestic (sum of government and private, but not disaggregated) HIV/AIDS spending. Given this inconsistency, we modeled the five financing source spending variables and raked and aggregated estimates to draw strength across areas with the highest data density. This process was implemented by averaging the domestic HIV/AIDS spending estimates with the aggregated domestic HIV/AIDS spending estimate formed by summing estimates of government and private HIV/AIDS spending. This averaged result represented our final estimate of domestic HIV/AIDS spending. We then raked estimates of government and private HIV/AIDS spending to the final domestic HIV/AIDS spending envelope to produce final private and government HIV/AIDS spending estimates. The final private HIV/AIDS spending estimates were then used as an envelope to rake OOP and prepaid private HIV/AIDS spending estimates. To propagate uncertainty, we conducted both aggregating and raking on the draw level. For estimates of total HIV/AIDS spending, we deterministically added development assistance, source from published literature<sup>6</sup>, to total domestic HIV/AIDS spending

To generate estimate of domestic HIV/AIDS spending by spending category (prevention, care and treatment, and other), we estimated domestic spending by spending category as the logit transformed fraction of total domestic spending. Not only did these models draw on reported domestic spending by spending category, but they drew on data reporting total spending by spending category. We equated these latter data to domestic spending by spending category by subtracting estimates of development assistance from analogous spending category. This process required us to map development assistance by HIV/AIDS health focus area to our spending categories. This mapping is presented in Table S5.5. If this process of equating data resulted a negative value, after checking the data point of incorrect extraction, we dropped the data point.

Estimates of domestic spending by spend category were raked to the total domestic spending envelope. Final estimates of HIV/AIDS total spending by spending category (i.e. total HIV/AIDS spending and total HIV/AIDS spending for each health function) were created by deterministically adding domestic spending to development assistance by spending category.

**Table S5.5: Mapping DAH focus areas to HIV/AIDS spending functions**

<b>HIV/AIDS spending functions</b>	<b>Development assistance for HIV/AIDS by health focus area.</b>
Prevention	Prevention, PMTCT
Care and treatment	Treatment, Care, Counseling and Testing
Other	Health system strengthening
	Unidentified

### S5.7 Development assistance for health

Development assistance for health (DAH) estimates were obtained from the Institute for Health Metrics and Evaluation's development assistance for health database. A more detailed description of the methodology used to obtain the estimates in the database can be found in Dieleman et al.<sup>6</sup> All known, systematically reported, available data on health-related disbursements and expenditures were extracted, as well as income and revenue from existing project databases, annual reports, and audited financial statements. DAH for bilateral agencies included all health-related disbursements from bilateral donor

---

agencies, excluding funds that they transferred to any of the other channels we tracked in order to avoid double-counting. This information was extracted from the Creditor Reporting System (CRS) and Development Assistance Committee (DAC) databases of the Development Assistance Committee of the Organisation for Economic Co-operation and Development (OECD/DAC).

In some cases, donor agencies did not report disbursement data to the CRS. A method for predicting disbursements from commitment data was implemented to address this challenge. For other grant- and loan-making institutions, annual disbursements on health grants and loans were similarly included, excluding transfers to any other channels and ignoring any repayments on outstanding debts. The annual disbursements for grant- and loan-making institutions only reflect the financial transfers made by these agencies. Therefore, in-kind transfers from these institutions in the form of staff time for providing technical assistance and the costs of managing programs were estimated separately. Estimates of DAH for the United Nations (UN) agencies included annual expenditures on health both from their core budgets and from voluntary contributions. Non-governmental organizations' (NGOs) DAH estimates utilized data from US government sources, Guidestar Research Fundamental Plus dataset and a survey of health expenditure for a sample of NGOs to estimate DAH from US-based and internationally based NGOs receiving support from the US government. To allocate DAH to HIV/AIDS and the program areas within development assistance for HIV/AIDS, we used a keyword search and tagged spending based on a weighted-average of keywords. Extensive details about all the steps involved in estimating DAH are in Dieleman et al.

## Introduction

The objective of this study is to provide data on future health spending patterns that can guide decision-makers. These analyses produced comprehensive and comparable set of gross domestic product and all-sector government spending estimates, followed by all the components of a country's total health expenditure. Additionally, using observed past trends, we predicted the possible trajectories of the covariates of interest conditional on following an optimistic and pessimistic pattern based on global rates of change.

The purpose of this appendix is to describe in detail the methodology used in our analyses. Subsequent sections contain information on all data sources, ensemble forecasting strategies, inclusion criteria, and uncertainty estimation used to generate our estimates, as well as our guidelines on how our future health scenarios analyses were conducted.

---

## **SECTION 6. FORECASTING HEALTH SPENDING FROM 2018 through 2050**

### **S6.1 Data**

#### **S6.1.1 Summary of Data Sources**

We used data from seven sources for the analyses:

- World Health Organization’s (WHO) Global Health Expenditure Database
- World Bank (WB) World Development Indicators database (WDI)
- International Monetary Fund’s (IMF) World Economic Outlook (WEO) October 2019 database
- Penn World Tables 9.1 (PWT)
- Angus Maddison Project Database 2018
- Institute for Health Metrics and Evaluation’s Development Assistance for Health Database 2019 (IHME)
- Institute for Health Metrics and Evaluation’s Global Burden of Disease Study 2017 (IHME GBD 2017)

Specifically, we collected health expenditure information on all available sources that is comparable across countries and complete for most countries from WHO and IHME, and demographic data from the WPP, while the underlying data for producing gross domestic product (GDP) and general government expenditure (GGE) were extracted from the IMF, WB, and PWT. Table S6.1 presents the definitions for the various health expenditure sources.

#### **S6.1.2 World Health Organization’s Global Health Expenditure Database**

We used Global Health Expenditure Database (GHED) data from the WHO to generate our estimates, which spans 191 countries between 2000 and 2017 (in the January 7th, 2020 version). From the GHED, we pulled the following variables:

- (i) Compulsory prepayment (Other, and unspecified, than FS.3)

- 
- (ii) Other revenues from NPISH n.e.c.
  - (iii) Other revenues from corporations n.e.c.
  - (iv) Other revenues from households n.e.c.
  - (v) Social insurance contributions
  - (vi) Transfers from government domestic revenue (allocated to health purposes)
  - (vii) Gross Domestic Product
  - (viii) Voluntary prepayment

To ensure we were using the best possible data, we downloaded the metadata for each data point for all of the indicators from the GHED website. We used the metadata to decide how each given data point should be weighted, from 1 to 5, being applied as inverse variance weights. We established guidelines for the metadata that informed how the underlying data points should be weighted, giving priority to factors such as complete, documented source information and penalizing factors such as having been derived or estimated. We adjusted these data by converting them from current local currency to 2019 US dollars. Details of the weighting guidelines and classification are explained in the supplementary appendix our retrospective analysis paper.

Once we have an incomplete set of data points for the health expenditure variables we are interested in forecasting, we used Spatiotemporal Gaussian process regression (ST-GPR) to model the full time-series for each variable across a total of 195 countries. ST-GPR is a stochastic modeling technique that is designed to detect signals amidst noisy data. Unlike classical linear models that assume that the trend underlying data follows a definitive functional form, GPR assumes that the specific trend of interest follows a Gaussian Process, existing with some pointwise mean and covariance function [1]. The covariates that were used in order to determine the initial fit of our health expenditure variables are: lag-distributed income, all-sector government expenditure per capita, and proportion of total population over the age of 64; using a Matérn covariance function for the distribution of the Gaussian process. Once we determined an initial prediction of our dependent variables, using the variability of data across regions, Gaussian process regressions (GPR) were run in order to estimate 1,000 draws of each country-year estimate per metric.

### **S6.1.3 WB WDI, IMF WEO, PWT, and Maddison**

The WDI Database provides data on a wide range of development related variables, including data on GDP and GDP per capita. Data series in this database begin in 1960 and span

---

through the present. The IMF’s WEO Database provides data on various macroeconomic indicators. Macroeconomic series data are available from 1980 to present. The PWT is a database that provides real national accounts data for 182 countries and territories from 1950 to 2017. The Maddison Project database provides historical GDP, GDP per capita, and population data dating as far back as Roman times. We utilized GDP per capita as a primary covariate to produce forecasts. GDP per capita from 1950 through 2020 was constructed using the method described in *James et al* [2]. The method utilized extracted data from a number of sources (IMF, WB, PWT and Maddison), and used multiple random effects models to estimate a mean GDP per capita series to be used in our analysis. Similarly, we used the same methodology to produce a mean general government expenditure (GGE) per GDP series, from 1980 through 2019.

#### **S6.1.4 Institute for Health Metrics and Evaluation’s Development Assistance for Health Database**

Development assistance for health estimates were obtained from the Institute for Health Metrics and Evaluation’s Development Assistance for Health Database. To generate these estimates, IHME collected audited budgets, annual reports, and project records from the primary development agencies providing assistance for the health sector. These records are augmented by information acquired via correspondence, and are standardized and compiled to provide a comprehensive perspective on international financial flows for health. These estimates are tracked backward to the source of the funds and forward to the country recipient, and are available from 1990 through 2019 and 2017, respectively.

#### **S6.1.5 Institute for Health Metrics and Evaluation’s Global Burden of Disease Study 2017**

Covariates used in forecasting health spending, such as populations and educational attainment per capita [3, 4], were obtained from the Institute for Health Metrics and Evaluation’s Global Burden of Disease Study 2017. Population forecasts used were from IHME’s Future Health Scenarios work, which uses a cohort component method of projection (CCMP [5]), and takes forecasts of age-specific fertility rates, mortality, migration, and the sex ratio at birth as inputs [6]. Age-specific fertility forecasts were projected by modeling completed cohort fertility as a function of met need for contraception and maternal education. Completed cohort fertility forecasts were then converted back to age-specific fertility rates. Net migration rates were forecasted as a function of the sociodemographic index, the crude popu-

---

lation growth rate, and mortality due to conflict, war and natural disasters. Total (all-cause) mortality was derived from forecasting cause-specific mortality from GBD 2017, using the three-component model described in Foreman et al [4]. Cause-specific mortality was then aggregated up the GBD 2017 cause hierarchy to generate total mortality forecasts, which were utilized to compute future life tables. Using past population from GBD 2017, the CCMP model advanced populations forward and produced country-age-sex specific estimates for single future calendar years.

---

## S6.2 Covariates

### S6.2.1 List of Forecasted Variables

The following are the list of variables which are forecasted in the manuscript:

- GDP: Gross Domestic Product (national income of a country)
- GGE: General Government Expenditure (all sector government expenditure in a country)
- $DAH_d$ : Development Assistance for Health donated
- $DAH_r$ : Development Assistance for Health received
- GHE: Government Health Expenditure
- OOP: Out-of-pocket Private Expenditure
- PPP: Prepaid Private Expenditure
- THE: Total Health Expenditure

### S6.2.2 Covariates Used for Forecasting

The following covariates are used as predictors, or independent variables, in our models:

- Total population of a country (1950 - 2050)
- Proportion of total population below the age of 15 (1950 - 2050)
- Proportion of total population above the age of 64 (1950 - 2050)
- Educational attainment per capita (1980 - 2050)
- An indicator variable used to denote the anomalous disbursement of DAH in our  $DAH_d$  forecasts (1 for years in 2000 - 2010, 0 otherwise)
- An indicator variable used to denote the Ebola crisis in Guinea, Sierra Leone and Liberia in our  $DAH_r$  forecasts (1 for years in 2014 and 2015 for the three aforementioned countries, 0 otherwise).

---

Additionally, we also use the forecasted GDP and GGE per capita as covariates to predict the health expenditure variables. Figure S6.1 in the Tables and Figures section shows our full pathway for forecasting all our endogenous variables and how each of those variable fed into a succeeding model.

In order to forecast GDP per capita, we first convert GDP per capita to GDP per working population in the following manner:

$$\text{GDP}_{\text{working population}} = \text{GDP}_{\text{total population}} \times \frac{\text{Working population (20-64 years old)}}{\text{Total Population}}$$

We forecast GDP per working population from 2021-2050 and convert back to GDP per capita for further analysis. The out-of-sample root-mean-squared-error (RMSE) based on using GDP per working population was smaller than forecasting with GDP per capita.

---

## S6.3 Ensemble Modeling

The purpose of ensemble modeling is to make sure that we capture the most out of what we have in our arsenal in terms of covariates and model specifications. We are agnostic about one model being the sole predictor of the future, and allow an ensemble of beliefs about predicting off of the past trends. ‘Ensembling’, in simple terms, is a way of pooling a number of sub-models, where the space of sub-models span different inclusions and combinations of predictors, and/or different econometric specifications.

### S6.3.1 Sub-model Setup

Our basic sub-model is a linear mixed effect model of the following form, for country  $i$  and time  $t$ :

$$\Delta_t Y_{i,t} = (\alpha + \alpha_i) + \left( \sum_{p=1}^3 \rho_p \Delta_t Y_{i,t-p} \right) + \Delta_t X' \beta + \varepsilon_{i,t} \quad (1)$$

where

$$(\alpha, \vec{\beta}) \quad \text{(Fixed effects)} \quad (2)$$

$$\alpha_i \sim N(0, \sigma_a^2) \quad \text{(Country specific random intercept)} \quad (3)$$

$$\varepsilon_{i,t} \sim N\left(\sum_{m=1}^3 \phi_m \varepsilon_{i,t-m}, \sigma_i^2\right) \quad \text{(Autocorrelated residuals as time random effects)} \quad (4)$$

‘Fixed effect’ is the equivalent of a non-random coefficient in a linear regression setting, and is estimated globally across all countries and time periods. The likelihood function for the data were all set to be Gaussian distributions for all of our metrics and models.

### S6.3.2 Covariates

Using our linear baseline model as defined in section S6.3.1, we created our set of ensemble sub-models by using all combinations of each of the covariates in Table S6.2. For example, if we were predicting GGE per GDP with Educational attainment and Population as the predictors, then we would get a possible combination of four specifications to use (including one with no fixed effects). All covariates were included as fixed effects, and all specifications had the random effect on country intercepts. The proportion of submodels used that contain particular submodel specifications are described in Table S6.3.

---

### S6.3.3 Convergence to Global Growth Rates

We believe that the very-long-term trajectory of a variable forecasted for each country will gradually taper to the global growth rates. The way that we implemented this growth rate convergence is in the following manner:

- 1) Suppose that we are forecasting  $Y_{i,t}$ , which includes an intercept at the global level and the country level. Let us also assume that there were  $\tilde{T}$  time periods of  $Y$  observed in the past for each country  $i$ .
- 2) We start the tapering of the growth rate to start from 10 years before  $\tilde{T}$  into the future starting from the present, converging to the global value 10 years after  $\tilde{T}$ . Therefore, if the present time period is  $H$ , then our decaying scheme will start off from the year  $h + \tilde{T} - 10$  and end at  $h + \tilde{T} + 10$ .
- 3) Our main objective is to slowly taper all the countries' random intercepts to decay to zero, so that they are all following a global intercept. In a first-difference model, since the intercepts represent the linear time trend, this scheme will slowly converge the linear time trends of all countries to decay to the global time trend.
- 4) Starting from the first year of decay, we will transform the country specific intercepts as such:

$$\hat{\alpha}_i = (\hat{\alpha}_i) \times \frac{20 - t}{20}$$

where  $t$  are all the time periods between  $h + \tilde{T} - 10$  and  $h + \tilde{T} + 10$ .

- 5) By the time  $t$  reaches  $h + \tilde{T} + 10$ , the value of  $\hat{\alpha}_i$  will have decayed to zero, and therefore, all the countries will have reached a global linear time trend estimate.

### S6.3.4 Specifications

- 1) **ARIMA (Autoregressive Integrated Moving Average) terms:** We allowed up to three degrees of lags in the model (traditional auto-regressive terms), where each degree of AR term will include itself and all other lower degrees of lags. For example, a GDP per capita model with AR(3) specification (predicting log of GDP per capita) will include once, twice and thrice lagged log GDP per capita term. These were included as fixed effects.

Additionally, in order to predict the best set of fixed effect coefficients, we test and include auto-correlated residuals in our models (traditional moving-average terms in an ARIMA

---

setup). This basically means that we allow our models to estimate the residuals with an autoregressive process of their own. These were included as random effects, and we allowed this to exist at the country-year level.

All of the variables we forecasted used the first-differences transformation (across time) as the dependent variable, except DAH received which was forecasted in non-differenced space, because of the presence of very high noise, thereby making the differenced series very unstable to forecast.

- 2) **Recency weights:** One of the other specifications we included in our sub-models was the option of weighting the recent years higher. This is particularly helpful for countries like Ethiopia and Nigeria, where they had rapid economic growth in recent years, and we believe that is a better predictor of the GDP forecasts than the further past. The weighting function was defined as such:

$$Weight = f(\tau, t) = (T - t + 1)^\tau \quad (5)$$

where  $T$  is the final year of in-sample data we have, and  $t$  is the year at that data point. This is an exponential decaying weighting function, where the degree of decaying is determined by  $\tau$ , and we test and include a set of values of  $\tau$  ranging between 0 and 0.5, where  $\tau = 0$  refers to equal weights (all time periods are weighed equally at 100). Given that  $\left. \frac{df(\tau, t)}{dt} \right|_{\tau > 0} < 0$ , this allows to weight our data with higher contributions to the likelihood from the recent past, and slowly decaying as we move further into the past towards the first observed time period. These recency weights were multiplied with the pointwise data variance parameter in order to weight the data points.

- 3) **Convergence Term:** We also allowed for the inclusion of a ‘convergence term’ in the list of sub-models. A convergence term is the one-year lag of the non-differenced dependent variable, and gets updated as each year is forecasted in the future. If a convergence term was considered in a sub-model, then we only included that sub-model if the coefficient on the convergence term was estimated to be negative (and statistically significant at 10% level).

---

## S6.4 Inclusion and Exclusion Criteria

After we ran all possible combination of our sub-models and created a mean set of forecasts, we only want to keep the best possible set of sub-models. Hence, we implied the following set of inclusion and exclusion criteria in order to filter out the ‘unrealistic’ sub-models:

- (1) All of the estimated coefficients must be **statistically significant at 10% level of significance**. For the fixed effects, we took the mean and the standard deviation of the posterior estimates, and filtered out the sub-model if the absolute z-score is below 1.645 (the absolute value of the one-sided 95th quantile of a standard normal distribution).

For the random effects, we look at the whether the measure of variance is statistically significant or not. The model outputs the mean and standard deviation of the *precision of the random effects*, and therefore allowed us to exclude the specification if the precisions are not statistically significant at 10% level.

- (2) If there were any estimated coefficient that **defied a prior belief we have on the direction of the value**, then we dropped that sub-model from consideration. For example, we strongly believe that as a donor country’s (high income countries) income (GDP per capita) grows, they will be able to donate more DAH to lower income countries, and so, if we ran a sub-model predicting  $DAH_d$  and get a negative coefficient on GDP per capita, we dropped that sub-model from consideration.

Our prior beliefs on the covariates for each dependent variable are listed in Table S6.2.

- (3) The forecasted trajectory growth **must not exceed observed growth rates**. We believe that a country will not grow faster than how much it has grown in the past trend. In order to come up with the bounds, we run a stochastic frontier analysis (SFA) of the change in the predicted variable against the level value of the predicted variable. SFA is just like an ordinary least squares specification, except with the addition of an additional ‘inefficiency’ term with a half-normal distribution. This allows us to estimate (for example, for GDP per capita): conditional of a country’s income, how much growth rate did we see in the country’s GDP. We ran this analysis across all of the observed data points, and derived a relationship binding the growth rates of GDP against the absolute values of GDP.

---

## S6.5 Creating the Forecasts

### S6.5.1 Ranking Sub-Models

In order to find out with sub-models would be able to predict a country's future the best, we ran out-of-sample predictive validity (OOS-PV) tests [7]. Simply put: we took each sub-model that passed the criteria in section S6.4, and instead of running it on all of the past data, we left out some number of recent most years. Following that, we ran the sub-model on the truncated past, and forecasted those years left out. For example, our GDP data extends from 1970 through 2020; we left out 15 years of data, and reran a sub-model from 1970 - 2005, and use the results of that sub-model to forecast GDP for the out-of-sample years (2006 - 2020).

This gave us essentially two trajectories between 2006 through 2020: the truth and the out-of-sample predictions. For each year, we computed the squared error (the difference) between these two lines, and averaged these errors for each of the neighboring years. So for example, we had squared errors for 15 data points between 2006 and 2020, and so the first mean squared error sum was just the squared error at 2006 and 2007, the second was the mean of the sum of squared errors for 2006, 2007 and 2008, and so on. We then took the square root of this new series to get the running root mean squared errors (RMSE) for a given country.

We looked at a country's 2006 RMSE values for each sub-models ran, and listed out the best 10% of the sub-models (that is, the lowest 10% RMSE values), and we did so for every year out-of-sample. For a single country, we may potentially have completely different set of sub-models for each of the OOS years. Then, for the 10% of the sub-models selected in the *first* year OOS, we only used those models to predict the *first* year of forecast for each country; the set of 10% of the sub-models selected in the *second* year OOS were used to predict the *second* year of forecast for each country, and so on, until the last year OOS model selections are used to compute the forecast the remaining years. This allowed us to narrow down every country's trajectory with the best performing OOS-PV sub-models for each year.

### S6.5.2 Uncertainty Estimation

To estimate the uncertainty intervals (UI), we reran the selected, ranked sub-models from section S6.5.1 and simulated draws instead of just getting a mean estimate of the future. There are four types of uncertainty we implemented in forecasting:

- (i) **Model Uncertainty** : This type of uncertainty comes from having more than one

---

type of specification to create forecasts, and therefore we included a set of sub-models in the ensemble to incorporate for this uncertainty (which are ranked within each country-year).

- (ii) **Data Uncertainty** : If our covariates themselves had draws of the future data (for example, when we forecasted GDP as a covariate to forecast PPP), then we picked randomly from the draws of the independent variable when predicting a sub-model's trajectory, if that covariate was included.
- (iii) **Parameter Uncertainty** : This type of uncertainty is due to the variance for the posterior distributions. Once we have run a sub-model, we simulated from each of the estimated posterior distribution to create a set of simulated coefficients. This is done by simulating from the joint precision matrix of all the parameters estimated, and therefore produces a correlated set of coefficients.
- (iv) **Fundamental Uncertainty** : The in-sample data and the fitted line in the past will never line up perfectly: there will always be errors from the model fit. We needed to reflect this level of uncertainty in our forecasts as well. By extracting these empirical residuals produced by a sub-model, we forecasted future country-specific residuals by using a random walk process, where the variance of the process is the variance of the residuals from the model fit  $\sigma_{\varepsilon}^2$ :

$$\hat{\varepsilon}_{i,t} \sim N(\varepsilon_{i,t-1}, \sigma_{\varepsilon,t}^2) \tag{6}$$

A random walk is an AR(1) process with the coefficient equal to 1: in other words, the current value is independent of last year's value (except for the starting position), and will propagate forward with a random Gaussian noise of  $\sigma_{\varepsilon,t}^2$  variance.

All of the above were used to simulate 1,000 forecasts (or draws), and so in order to construct our UIs, we took the mean and the values of the 2.5th and 97.5th quantiles to estimate 95% UIs.

Table S6.4 shows all of the retrospective and prospective estimates of our health spending outcomes in 2019 US dollars and 2019 purchasing-power parity-adjusted dollars in per capita space.

---

## S6.6 Ad-hoc Draws Correlation

### S6.6.1 Motivation

Given our current setup of compiling draws for each single year, there is no way of enforcing a temporal correlation across the draws right from the ensemble architecture. For example, the sub-models used in the first 15 years of GDP per capita forecasts were independently constructed and only depended on OOS-PV fits, while the 10th year (2036) onwards all draw from the same set of sub-models. This section details on the method used to generate the same correlation in the first 10 years of that example, drawing from the existing correlation from the 10th year onwards.

### S6.6.2 Bivariate Correlated Distributions

Using the GDP per capita example: following from uncertainty estimation, once we generated approximately 1,000 forecast draws for a country and year for any of the covariates, we used the following strategy to achieve consistent temporal correlation across all time periods in the future:

- (a) For each country, we recorded country-specific Spearman's correlation coefficient across all draws between 2036 and 2050, which gave us a country-specific correlation vector.
- (b) For each value of correlation in step (a), we simulated a bivariate uniform distribution for each country and year (2018 through 2036). This simulated distribution was ranked in such a way that the marginal distributions in the joint distribution were correlated with that value of correlation coefficient we supplied (this joint distribution is known as a *copula*).
- (c) We recorded the ranks of the copula, and sorted our draws (within each country) using those temporal ranks, and therefore we ended up with a complete time-series data for all draws, such that each country and year will follow the same rank correlation structure that exists between 2036 and 2050.
- (d) Finally, we calculated our final set of uncertainty intervals by taking the 2.5th and 97.5th percentiles of these correlated draws.

We used this method at the end of forecasting every metric, since one metric fed into the other sequentially.

---

## S6.7 Future Health Scenarios

We established the trajectories that our health expenditures are expected to take in the next 33 years using our ensemble models (from hereby referred to as the ‘reference’ case). The reference forecasts were built upon the basis of each country’s past trends and expected future trends from covariates. We additionally also predicted what the possible trajectories for each country would look like if they were to follow the possible optimistic and pessimistic growth rates observed globally (referred to as ‘better’ and ‘worse’ cases, respectively).

### S6.7.1 Long-term Growth Regressions

In order to determine what the possible better and worse growth rates for each country would be, we ran long-term growth regressions with the following specification:

$$Y_{i,T} - Y_{i,t} = \alpha + \beta Y_{i,t} + \epsilon_{i,t} \quad (7)$$

where the dependent variable represented the long term growth rate of  $Y$  for country  $i$ , which was computed either as logarithmic or logistic growth rates (for fractions).

The only independent variable we used ( $Y_{i,t}$ ) was the value of  $Y_i$  at time  $t$ , and it served as a convergence term in this regression. This allowed us to predict the long-term growth rates of  $Y$ , conditional on a country’s level of  $Y$  at time  $t$ .

### S6.7.2 Forecasting Better and Worse Scenarios

In order to estimate what the future better and worse trajectories would be for each country, we followed these steps (assuming that we are forecasting from 2018 through 2050, with observed data between 1995 and 2017):

- (i) We computed the 85th and 15th percentiles of the empirical residuals  $\epsilon$ , as  $Q_{0.85}(\hat{\epsilon}_{i,t})$  and  $Q_{0.15}(\hat{\epsilon}_{i,t})$  respectively, where  $Q_p(\cdot)$  is a quantile function for a percentile  $p$ .
- (ii) We computed the starting annualized growth rate from the fitted scenario regression, such that, for country  $i$ :

$$\text{Better growth rate} = \exp(\hat{\alpha}) \times \exp(Q_{0.85}(\hat{\epsilon}_{i,t})) \times (Y_{i,2017}^{\hat{\beta}})^{(1/(2017-1995))} \quad (8)$$

$$\text{Worse growth rate} = \exp(\hat{\alpha}) \times \exp(Q_{0.15}(\hat{\epsilon}_{i,t})) \times (Y_{i,2017}^{\hat{\beta}})^{(1/(2017-1995))} \quad (9)$$

- (iii) Finally, once we have established the growth rates as a function of the convergence term, we recursively created better and worse trajectories, conditional on the updated

---

growth rates every year, such that:

$$Y_{i,t+1} = Y_{i,t} \times \exp(\hat{\alpha}) \times \exp(Q_{0.85}(\hat{\epsilon}_{i,t})) \times (Y_{i,t}^{\hat{\beta}}) \quad (10)$$

where  $\exp(\hat{\alpha}) \times \exp(Q_{0.85}(\hat{\epsilon}_{i,t})) \times (Y_{i,t}^{\hat{\beta}})$  was the conditional growth rate for a single year.

One condition that we imposed for the computed scenarios is: the better projection cannot be lower than the reference projection, and the worse projection cannot be higher than the reference projection. For countries with wide forecasts where this case did happen, we moved the better and worse forecasts down and up to overlap on top of the reference line respectively.

### S6.7.3 Uncertainty Estimation

The uncertainty intervals around a scenario were expected to take the same shape as the uncertainty around our reference forecasts. Therefore, once we have propagated a mean set of better and worse forecasts in section S6.7.2, we created the draws around our scenarios in the following way:

- (i) We took our reference forecast's mean line and the 1,000 draws around that line.
- (ii) We computed the deviation of the mean from each of the draws (in logarithmic or logistic transformation, depending on the space of the covariate).
- (iii) We took each of the scenario mean lines and added the deviations from the previous step to the mean lines, giving us 1,000 draws of the scenario projections.

Figure set S6.3 visualizes the future health scenarios of our health outcomes in per capita space (in 2019 US dollars).

---

## S6.8 Package and Architecture

### S6.8.1 Architecture

All analysis and forecasting were done on a parallel computing cluster with 26,000 cores with a CentOS interface. We compiled R [8] version 3.6.0 from source code on a Docker based on Debian OS, which was deployed as a Singularity container with all the necessary compilers and binaries (GCC, G++ and Fortran 8.2.0).

### S6.8.2 Template Model Builder

We used the R library **TMB** [9] to run our baseline mixed effects models. TMB stands for Template Model Builder, and it's a powerful method of approximating the integral of the Gaussian probability distribution function (which doesn't exist in closed form) by using a Laplace Approximation, which gives very precise results, and is relatively faster than other approximation packages which exist like Stan or Bugs. TMB uses automatic differentiation on the negative log-likelihood function in order to optimize the model parameters, and also returns a sparse joint precision matrix (inverse of the variance-covariance matrix), from which we can simulate posterior parameter draws.

## S6.9 Tables and Figures

Table S6.1: Definitions of health expenditure sources

Health Expenditure Type	Definition
Development assistance for health	Financial and in-kind contributions from global health channels that aim to improve or maintain health in low- or middle-income countries.
Government health expenditure as source	Government health expenditure as source only includes domestically financed government expenditure on health, including public health spending.
Out-of-pocket expenditure	Paid by individuals for health services; considered catastrophic if exceeding 40% of a household's annual income.
Prepaid private health expenditure	Private risk pooling against catastrophic health expenditure; includes private insurance and non-governmental organizations.
