

Mean Change in Visual Acuity over Time

All Follow-up Study Participants

Supplemental Figure 2.

Mean change in visual acuity over time among follow-up participants from a 2-year clinical trial on anti-vascular endothelial growth factor treatment for eyes with diabetic macular edema (Protocol T). Change in visual acuity was truncated to the mean \pm 3 standard deviations of the change from baseline to 5 years ($7.12 \pm 3 \times 16.04$). Eyes missing visual acuity at the 5-year visit were excluded.
