

## Mean Change in Central Subfield Thickness over Time

### Follow-up Study Participants with Baseline Visual Acuity of 20/50 to 20/320

Supplemental Figure 3.

Mean change in optical coherence tomography central subfield thickness over time among follow-up study participants with baseline visual acuity of 68 to 24 letters (approximate Snellen equivalent 20/50 to 20/320) from a 2-year clinical trial on anti-vascular endothelial growth factor treatment for eyes with diabetic macular edema (Protocol T). Change in central subfield thickness was truncated to the mean  $\pm$  3 standard deviations of central subfield thickness change from baseline to 5 years ( $-154.5 \pm 3 \times 154.81$ ). Eyes missing central subfield thickness at the 5-year visit were excluded.
