

Supplemental Figure 1. Prediction-corrected visual predictive check for plasma anidulafungin concentration versus time after first dose for the final model, stratified by age group

Dashed lines represent the 90% confidence intervals (95% upper limits and 5% lower limits) of observed and simulated data, respectively. Solid lines are medians (50%) of observed and simulated data, respectively. Dots represent observed data. Shadow areas are 95% confidence intervals for the 2.5th, 50th, and 97.5th percentile prediction intervals based on simulated data.
