

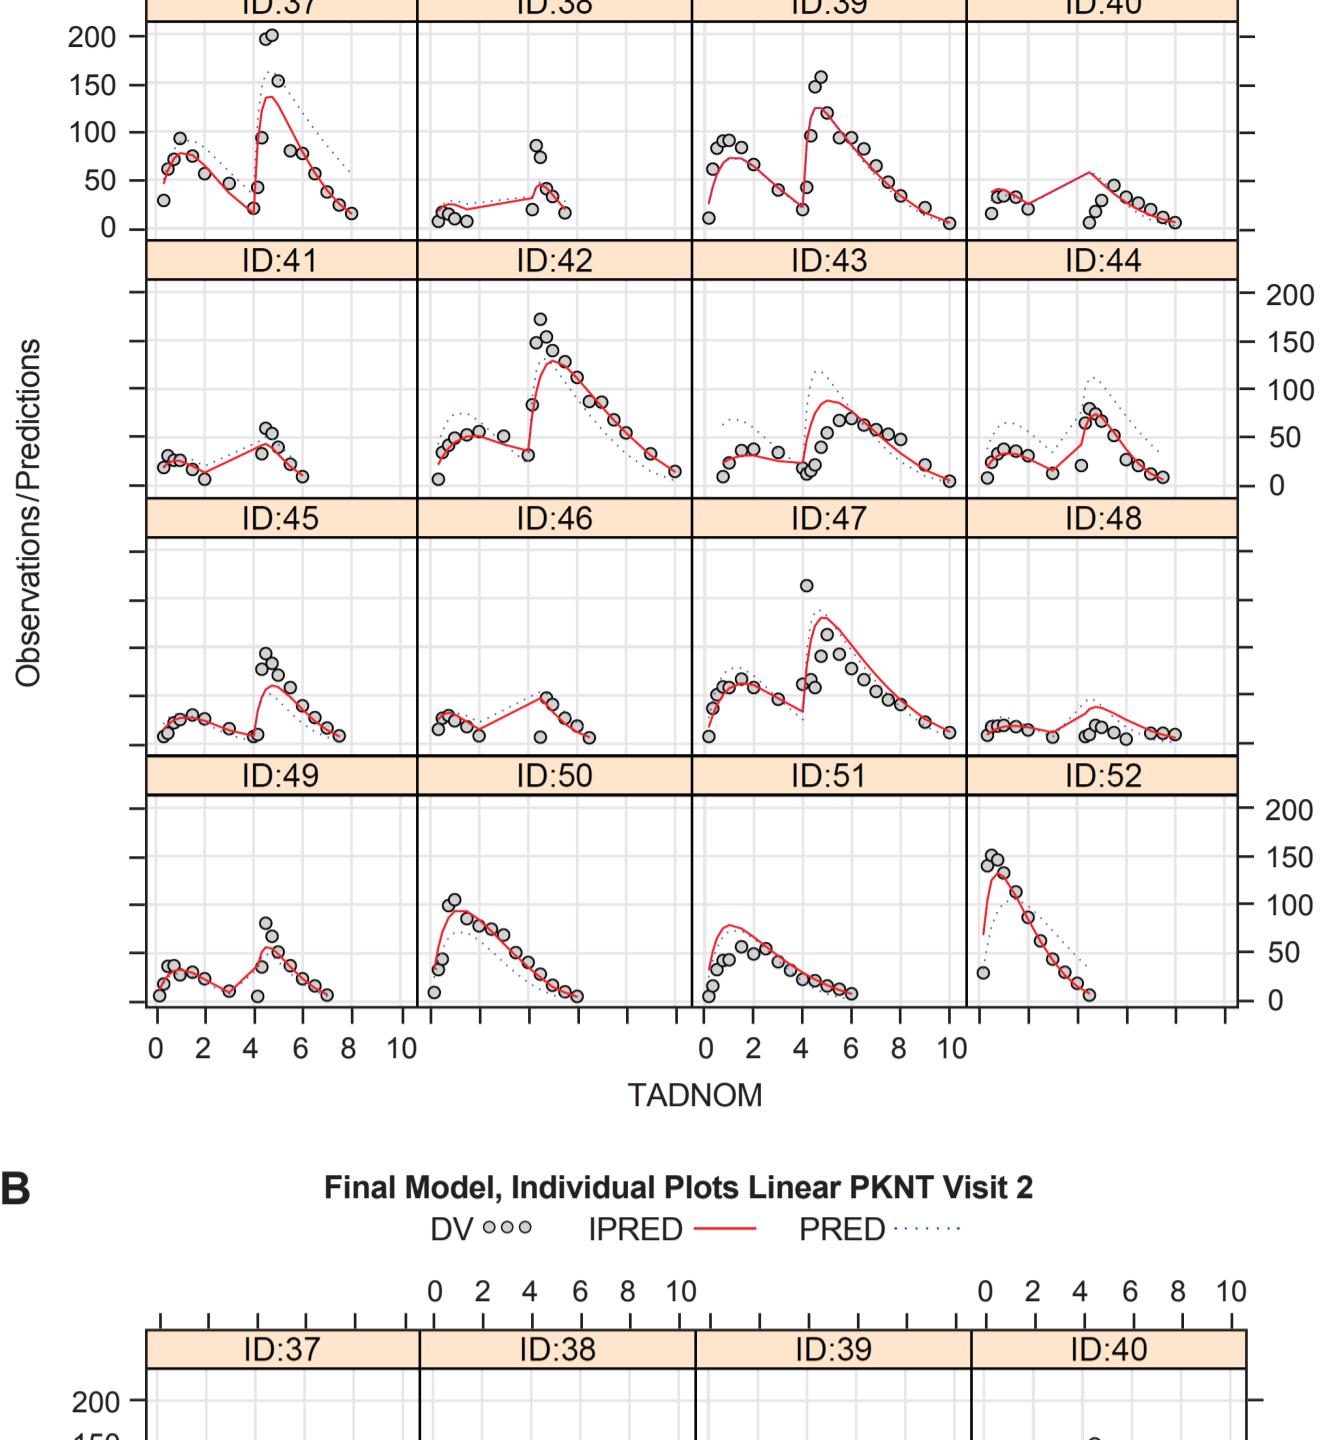

Figure S3. Representative sample of observed plasma oxybate concentrations vs values predicted by the population PK model in individual study participants.

A

Final Model, Individual Plots Linear PKNT Visit 1

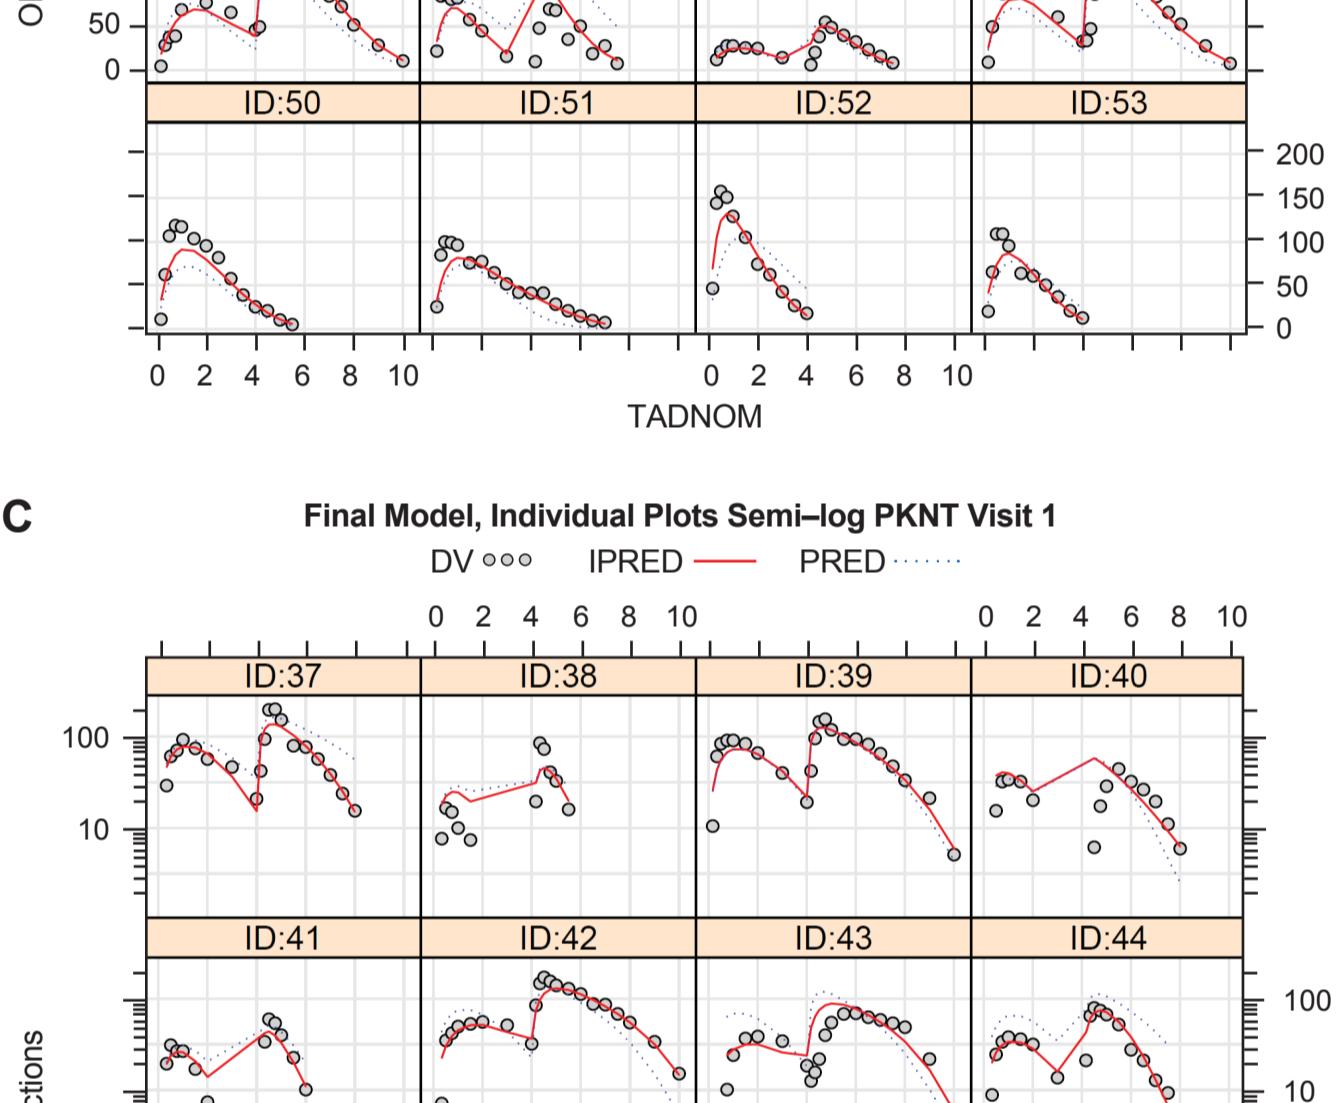

DV ○○○ IPRED — PRED ·····

B

Final Model, Individual Plots Linear PKNT Visit 2

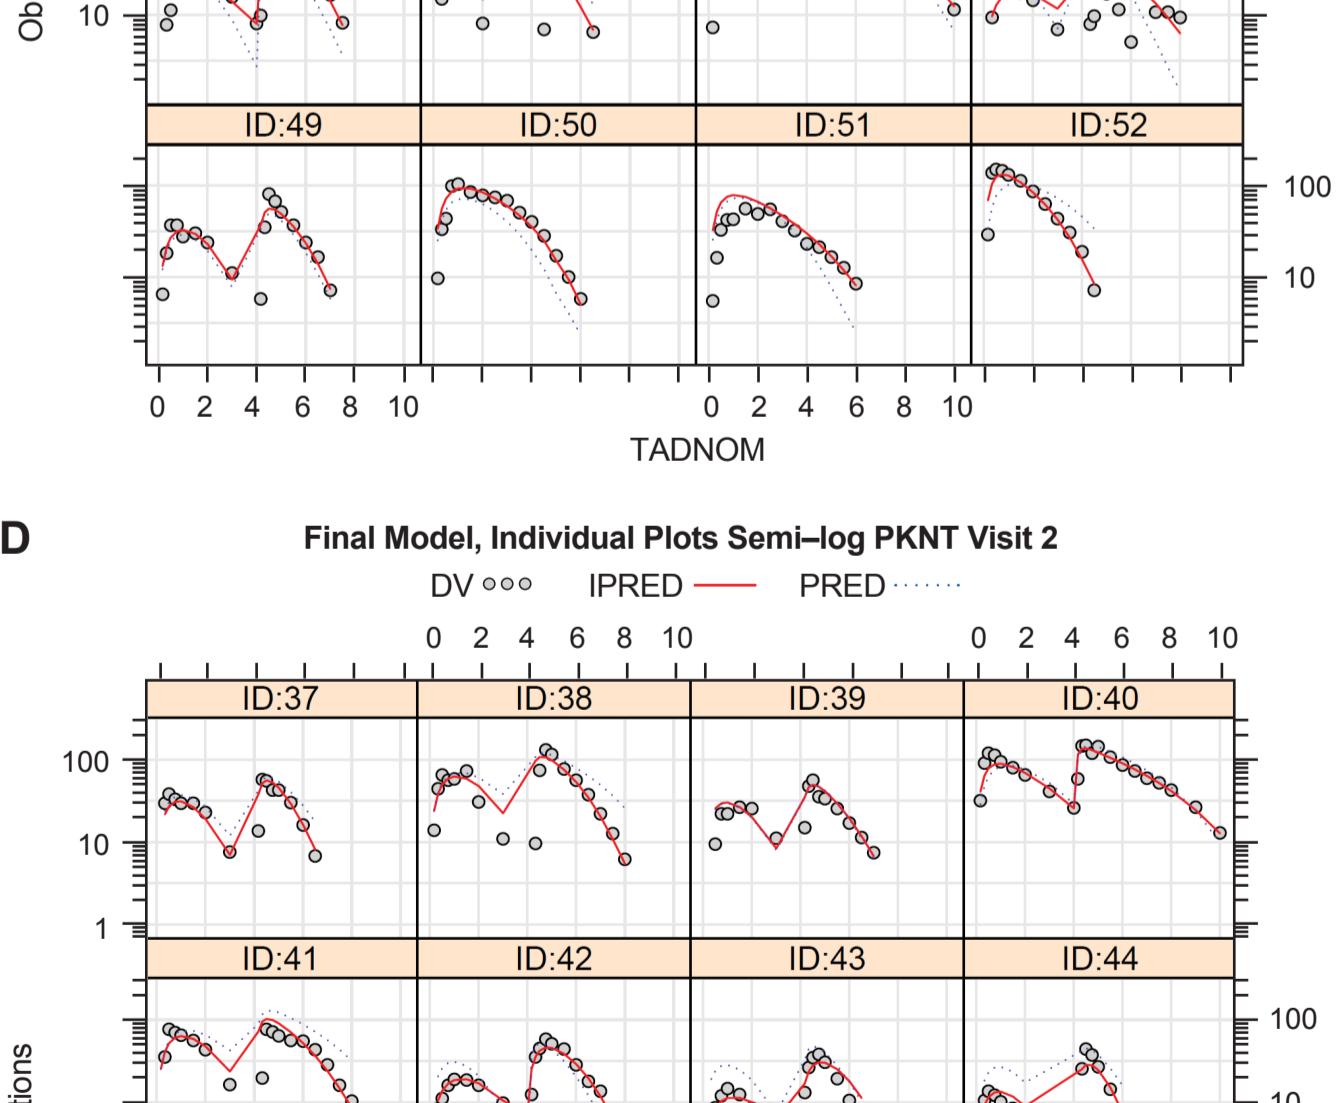

DV ○○○ IPRED — PRED ·····

C

Final Model, Individual Plots Semi-log PKNT Visit 1

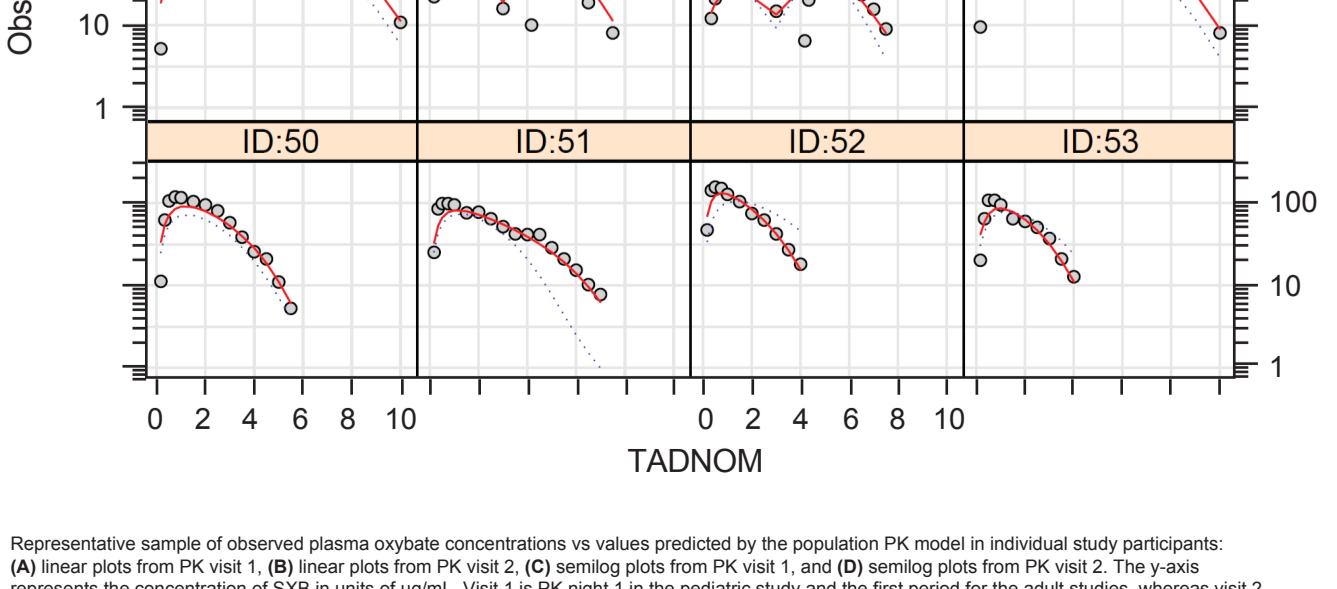

DV ○○○ IPRED — PRED ·····

D

Final Model, Individual Plots Semi-log PKNT Visit 2

DV ○○○ IPRED — PRED ·····

Representative sample of observed plasma oxybate concentrations vs values predicted by the population PK model in individual study participants:

(A) linear plots from PK visit 1, (B) linear plots from PK visit 2, (C) semilog plots from PK visit 1, and (D) semilog plots from PK visit 2. The y-axis represents the concentration of SXB in units of $\mu\text{g/mL}$. Visit 1 is PK night 1 in the pediatric study and the first period for the adult studies, whereas visit 2 is PK night 2 in the pediatric study and the second period for the adult studies. DV (open black circles), observed data value for concentration of oxybate; ID, participant identification number; IPRED (solid red line), individual predicted value for concentration of oxybate; PK, pharmacokinetics; PKNT, nominal time for PK samples; PRED (dashed blue line), population predicted value for concentration of oxybate; SXB, sodium oxybate; TADNOM, nominal time after dose.
