

Supplementary Figure 1

Supplementary Figure 1 – Pyroptosis-induced caspase 1 processing in BMDM. BMDM were prepared from wild type (WT) or gasdermin D knockout (*Gsdmd*^{-/-}) mice. The cells were primed or not with LPS (0.5 μ g ml⁻¹) for 5h and treated with or without nigericin (Ng, 20 μ M) as indicated. Cell lysates were prepared and immunoblotted with an anti-caspase 1 antibody. Note the appearance of the p10 fragment following LPS + Ng treatment, indicative of inflammasome activation. Data are representative of results from n=3 independent experiments.
