Figure S34. CO evolution and turnover numbers as a function of irradiation time. Reactions were performed with 1mM concentration for **1** and 0.5 mM concentration for **2a**.

9. Crystallographic data for complexes **1**, **2a**, **2b** and **2c**

Crystallographic data for compounds **1**, **2a**, **2b** and **2c** reported in this paper have been deposited with the Cambridge Crystallographic Data Centre as supplementary information no. CCDC-1988207–1988210. Copies of the data can be obtained free of charge from <https://www.ccdc.cam.ac.uk/structures/>.

Experimental Details.

Single crystal X-ray diffraction data were collected on a STADI VARI diffractometer with monochromated Ga K α ($\lambda = 1.34143 \text{ \AA}$) or Mo K α ($\lambda = 0.71073$) radiation at low temperature. Using Olex2,^[1] the structures were solved with the ShelXT^[2] structure solution program using Intrinsic Phasing and refined with the ShelXL^[3] refinement package using Least Squares minimization. Refinement was performed with anisotropic temperature factors for all non-hydrogen atoms; hydrogen atoms were calculated on idealized positions.

Figure S35. ORTEP structure of complex **2c** shown at the 50% probability level. Hydrogen atoms, counterion and solvent molecules were omitted for clarity.
