

S1 Table. Distribution change statistics for nine wildlife species in the New England region of the northeastern United States. Statistics were calculated from scenario-simulated distribution change maps (2010 – 2060) derived from species-specific distribution models developed by [62] and landscape change scenarios developed by the New England Landscape Futures Project [31,58].

Species	Scenario	Mean	Standard deviation	Minimum	Quartiles			Maximum
					25%	50%	75%	
American black bear	RT	-0.12	0.22	-0.94	-0.20	-0.05	0.00	0.82
