Table S4: PCr levels determined from ^1H MR measurement and cerebral cortex water concentrations in mouse brains at different ages. All values are in mean \pm standard deviation.

Age (days)	[PCr] (mM)	% Water (w/w)
P20	3.603 0.728	78.9 0.42
P40	3.300 0.892	77.7 0.41
P90	2.926 0.289	77.1 0.39
P250	3.319 0.563	77.1*

*assuming water content remains stable at adulthood

Table S5: Levels and CRLBs of NAD $^+$, NADH, RR and total NAD obtained at P20, P40, P90 and P250, respectively. All values are in mean \pm standard deviation.

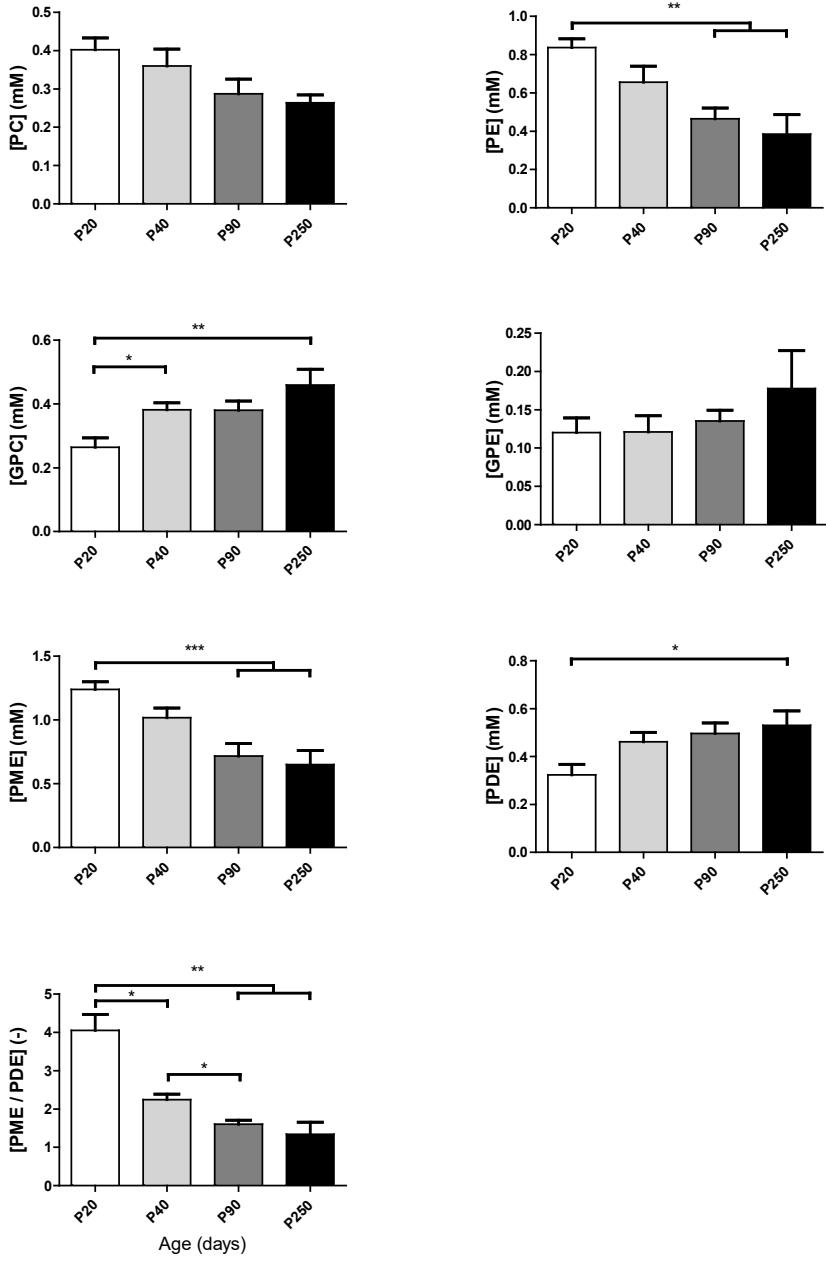

Figure S1: Changes of individual brain phosphoester compounds with age. Phosphomonoester (PME) is the sum of PC + PE, and phosphodiester (PDE) is the sum of GPC + GPE. The change of PME/PDE with age reflects decreased membrane turnover from postnatal day P20 to P250. All values are the mean \pm SEM and significant differences are derived from the post hoc Bonferroni correction test for multiple comparisons. ** $P < 0.01$, **** $P < 0.0001$

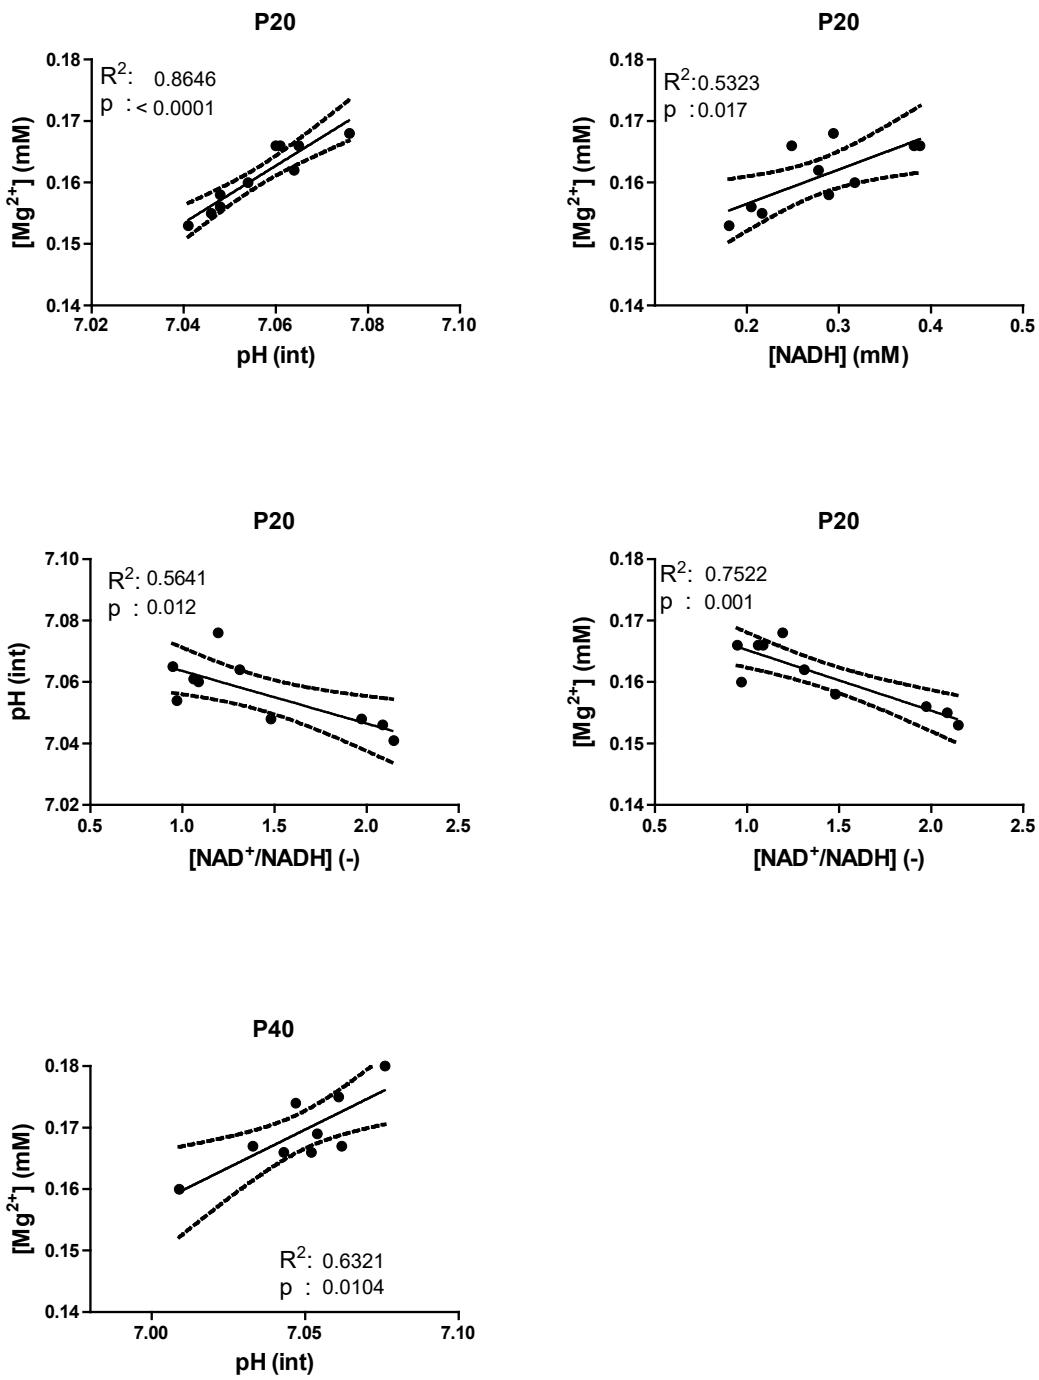

Figure S2: Plots of significant correlations between pH^{int} , free $[\text{Mg}^{2+}]$ and NAD metabolites. P values are depicted together with correlation coefficients R^2 obtained from the two-tailed Pearson correlation.
