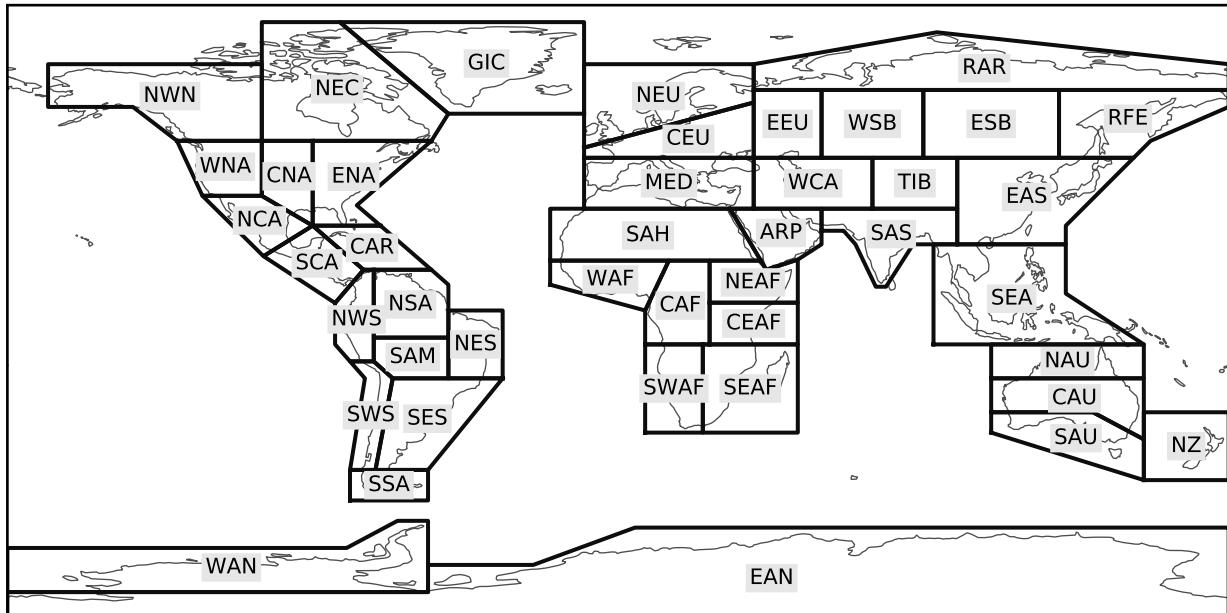

Figure S1: Regions used for analyses, based on preliminary IPCC AR6 regions (Iturbide et al., 2020):
 1. GIC: Greenland/Iceland, 2. NEC: N.E. Canada, 3. CNA: C. North America, 4. ENA: E. North America, 5. NWN: NW North America, 6. WNA: Western North America, 7. NCA: Northern Central America, 8. SCA: Southern Central America, 9. CAR: Caribbean, 10. NWS: NW South America, 11. SAM: South-America Monsoon, 12. SSA: Southern South America, 13. SWS: SW South America, 14. SES: SE South America, 15. NSA: N. South America, 16. NES: NE South America, 17. NEU: N. Europe, 18. CEU: C. Europe, 19. EEU: E. Europe, 20. MED: Mediterranean, 21. WAF: W. Africa, 22. SAH: Sahara, 23. NEAF: NE Africa, 24. CEA: Central East Africa, 25. SWAF: SW Africa, 26. SEAF: SE Africa, 27. CAF: Central Africa, 28. RAR: Russian Arctic, 29. RFE: Russian Far East, 30. ESB: E. Siberia, 31. WSB: W. Siberia, 32. WCA: W.C. Asia, 33. TIB: Tibetan Plateau, 34. EAS: E. Asia, 35. ARP: Arabian Peninsula, 36. SAS: S. Asia, 37. SEA: S.E. Asia, 38. NAU: N. Australia, 39. CAU: C. Australia, 40. SAU: S. Australia, 41. NZ: New Zealand, 42. EAN: E. Antarctica, 43. WAN: W. Antarctica.

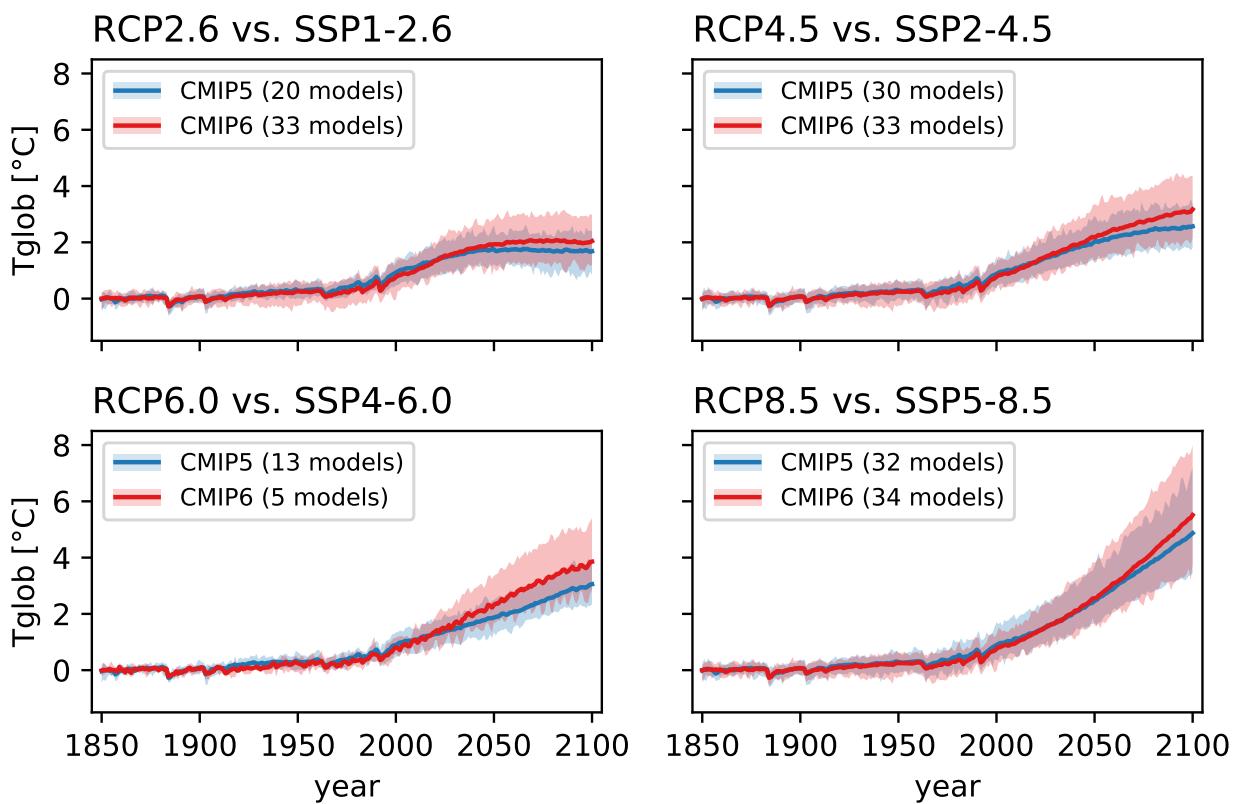

Figure S2: Time series of global mean warming in CMIP5 and CMIP6 ensembles, subdivided by scenario type.

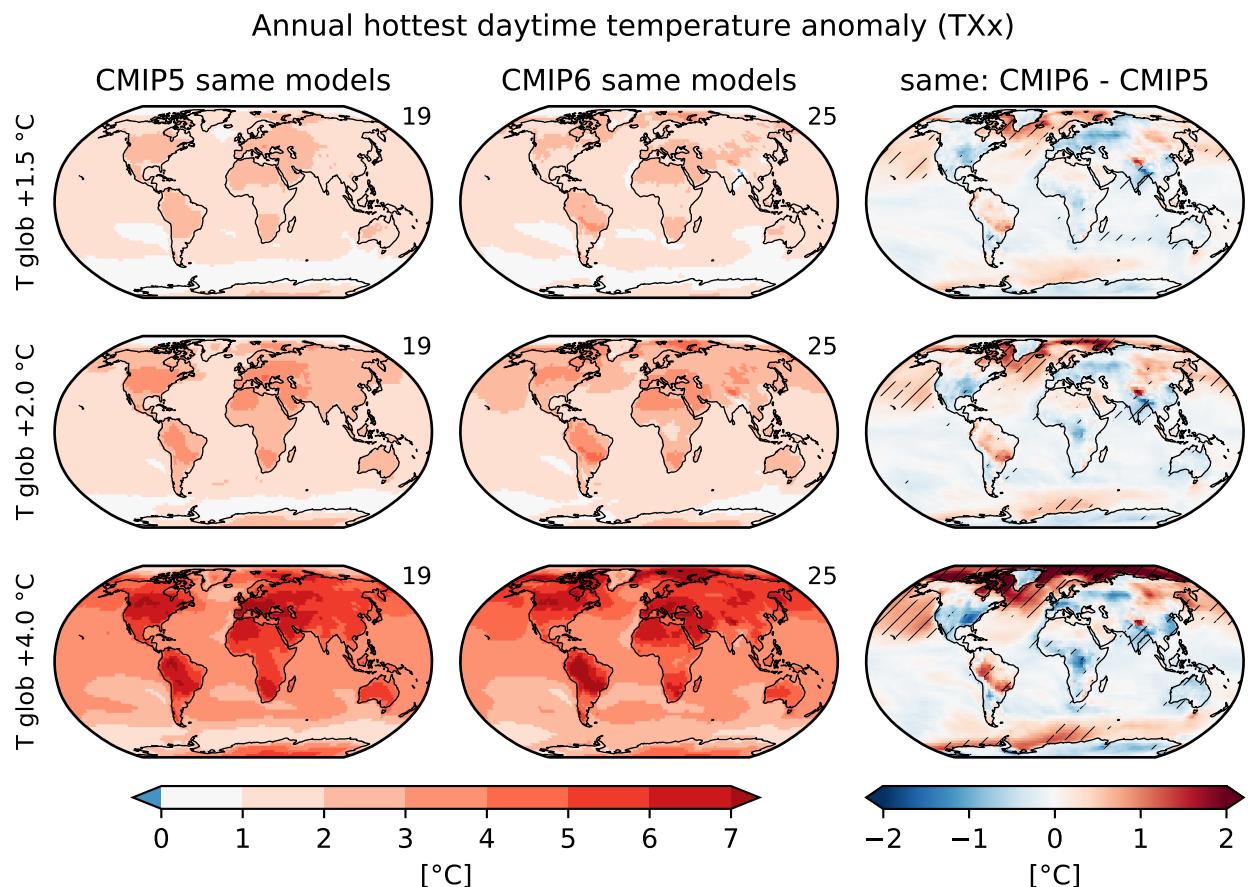

Figure S3: Anomalies in the annual hottest daytime temperature (TXx) compared to pre-industrial (1850-1900) conditions for different global warming levels (rows) in CMIP5 (left column), CMIP6 (center column), using the same models for all temperature levels, and the CMIP6-CMIP5 differences (right column). Statistically significant differences are hatched.

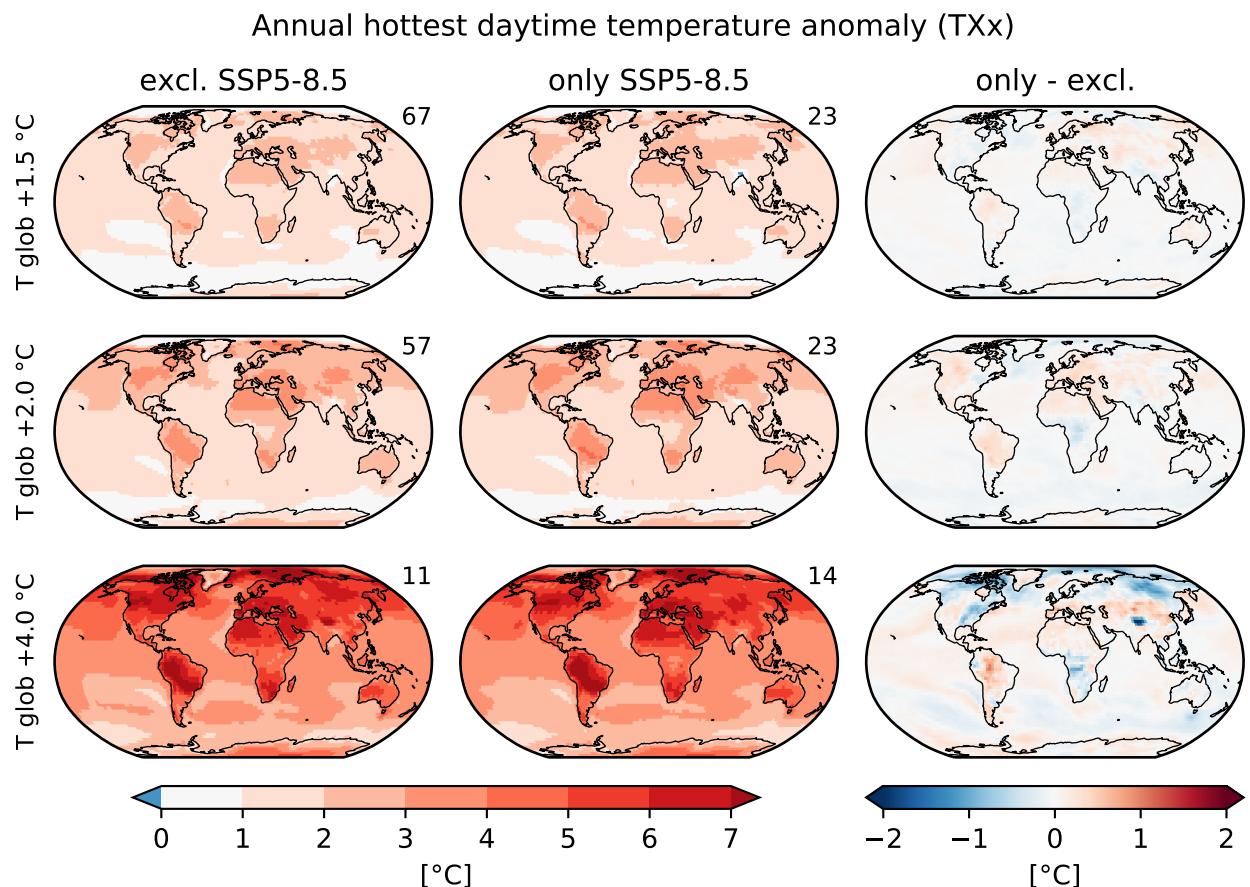

Figure S4: Anomalies in the annual hottest daytime temperature (TXx) compared to pre-industrial (1850-1900) conditions for different global warming levels (rows) using only the SSP5-8.5 scenario (left column), using all SSPs excluding (excl.) SSP5-8.5 (center column), and their differences (right column). Significant differences are hatched.

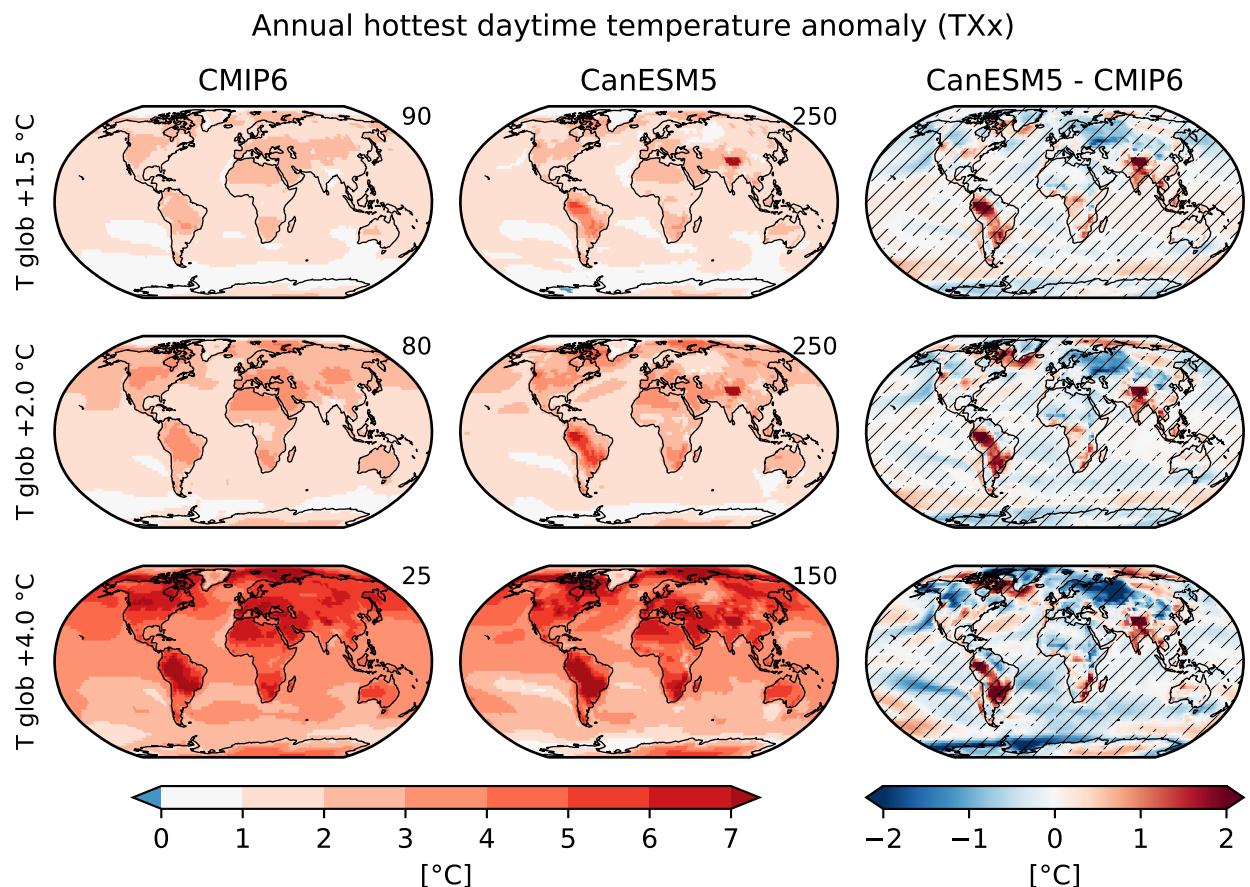

Figure S5: Anomalies in the annual hottest daytime temperature (TXx) compared to pre-industrial (1850-1900) conditions for different global warming levels (rows) using all ensemble members of the CMIP6 model CanESM5 (left column), using one ensemble member of each CMIP6 model (center column), and their differences (right column). Significant differences are hatched.

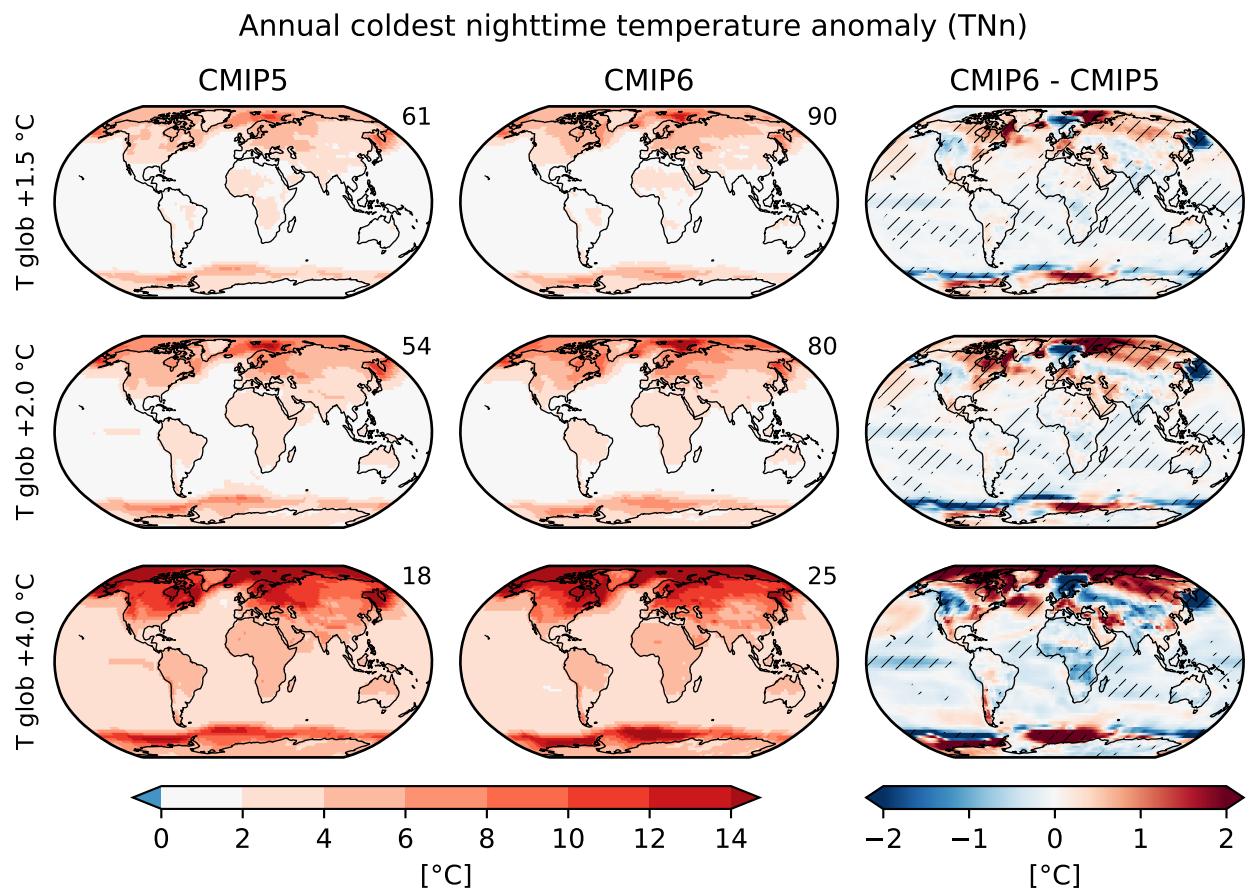

Figure S6: Anomalies in the annual coldest nighttime temperature anomaly (TNn) for different warming levels (rows) in CMIP5 (left column), CMIP6 (center column), and their difference (right column). Significant differences are hatched.

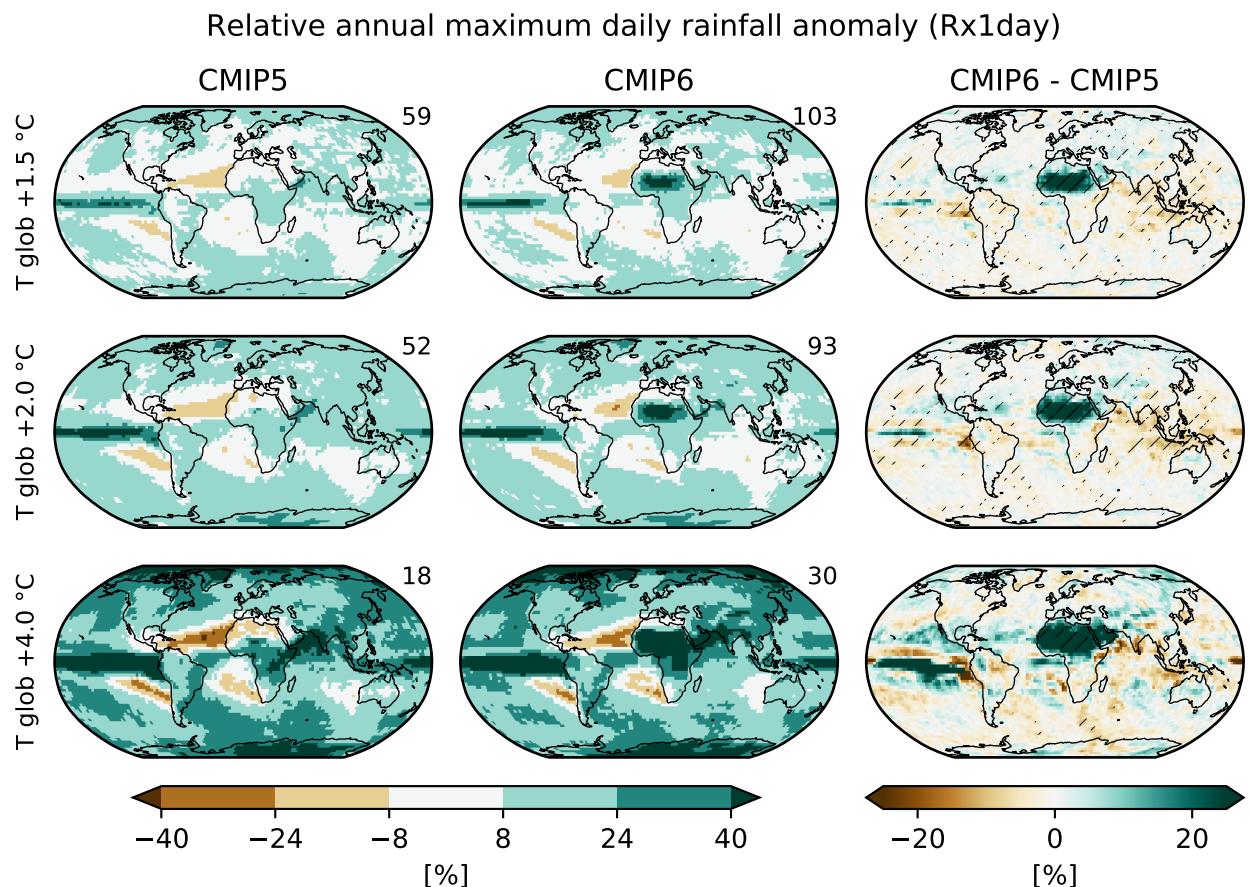

Figure S7: Relative anomalies in the annual maximum daily rainfall (Rx1day) for different warming levels (rows) in CMIP5 (left column), CMIP6 (center column), and their differences (right column). Statistically significant differences are hatched.

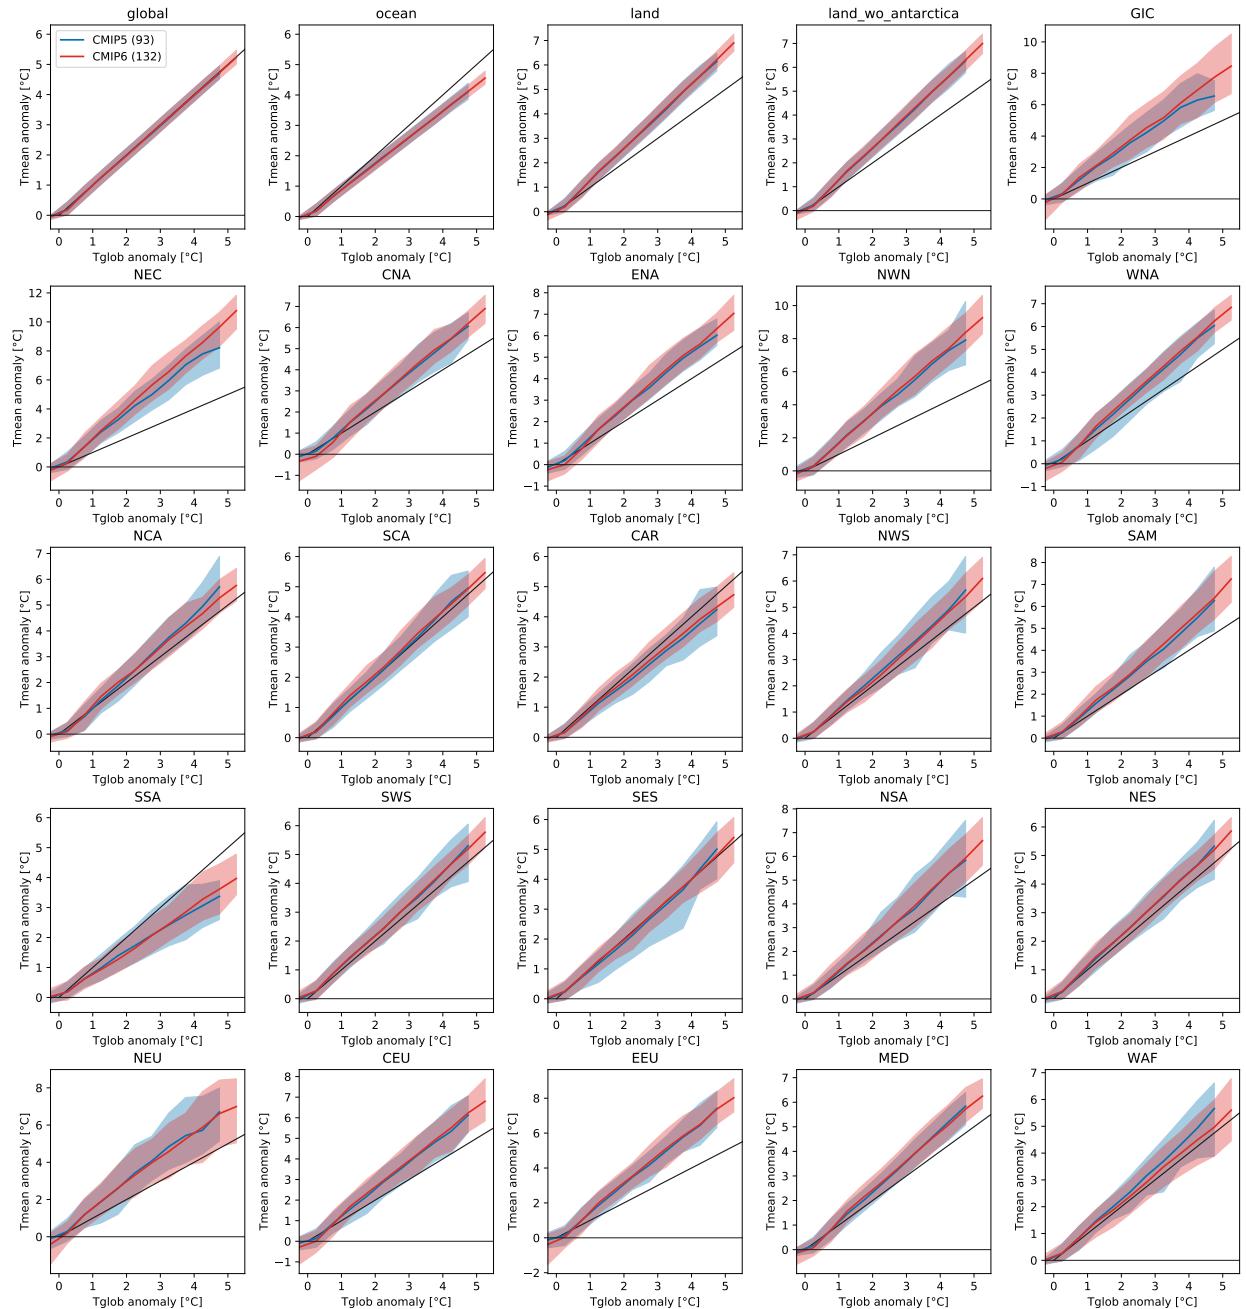

Figure S8: Scaling of annual mean temperature (Tmean) with global mean temperature for the AR6 land regions. Shown is the CMIP5 and CMIP6 multi model mean and their range, for the global mean, ocean mean, land mean, land mean except Antarctica, and regions 0 to 21 of the AR6 land regions.

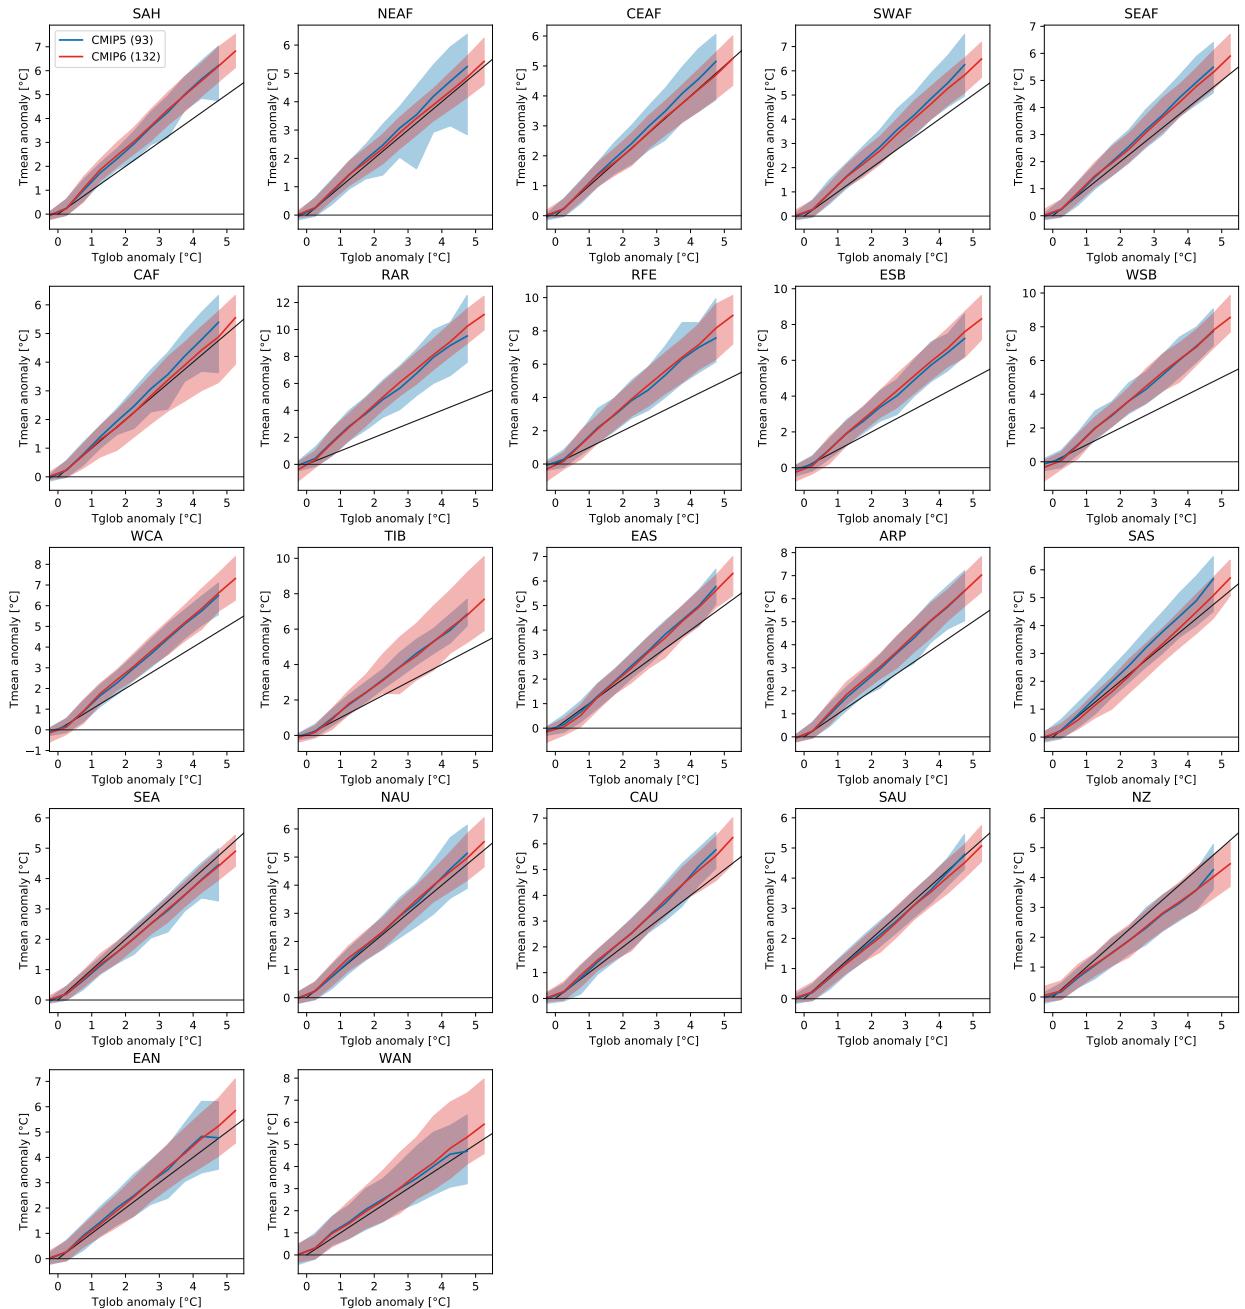

Figure S9: As Figure S8 for regions 22 to 43.

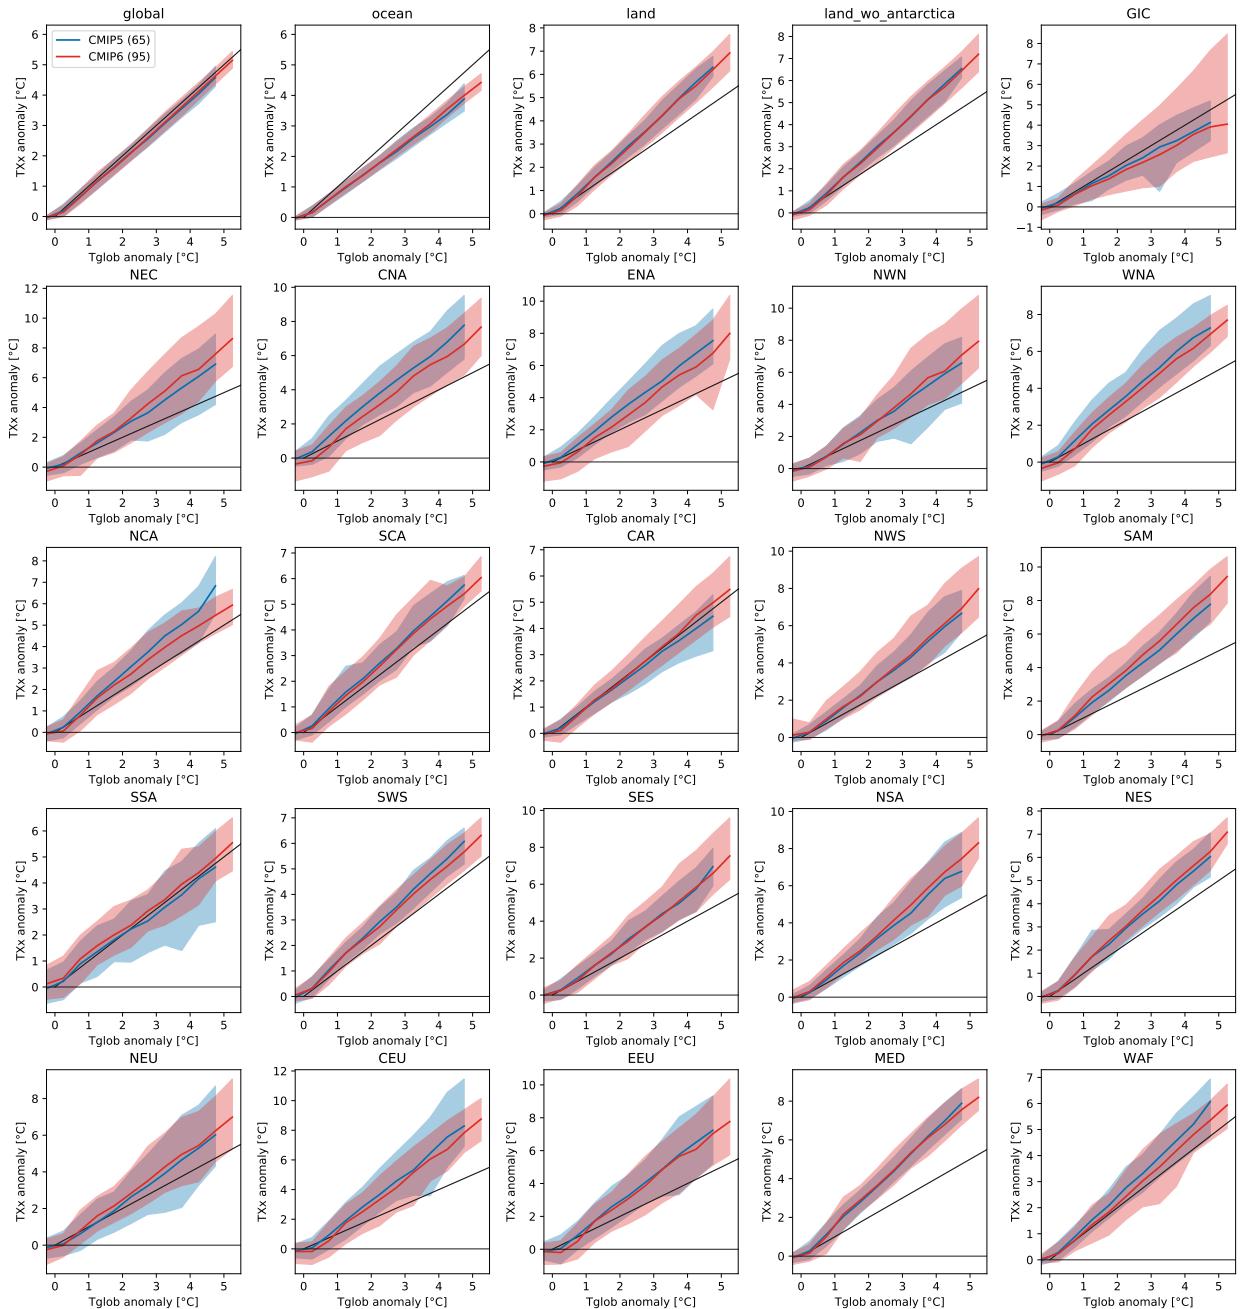

Figure S10: As Figure S8 but for TXx.

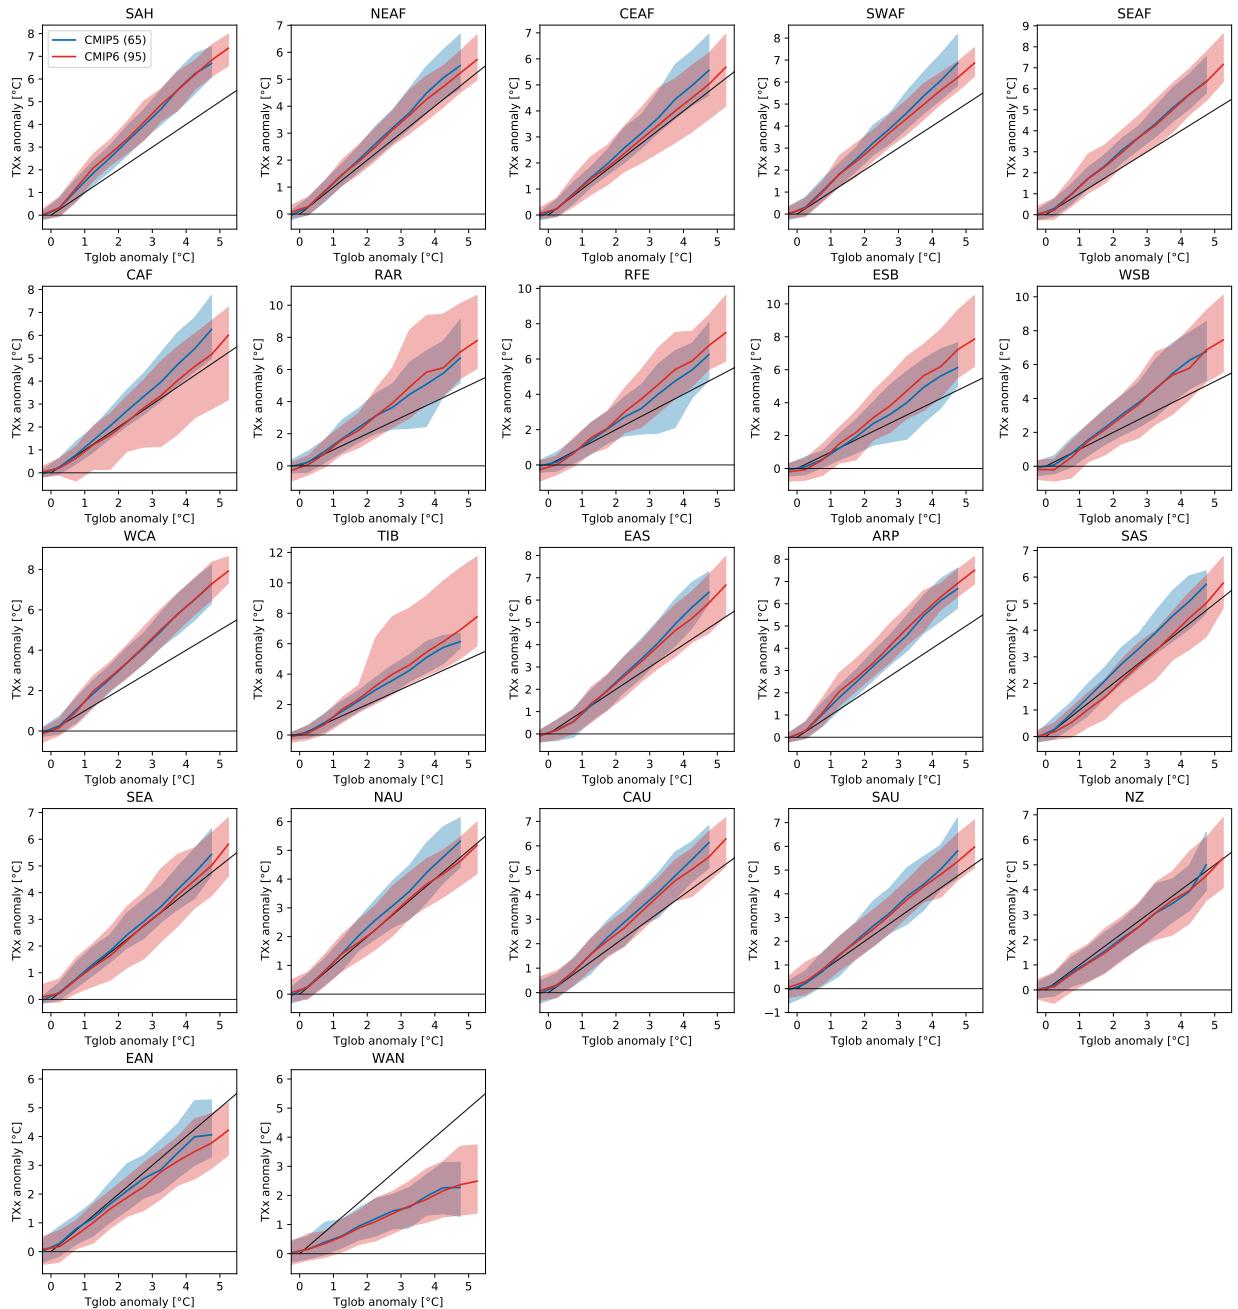

Figure S11: As Figure S10 for regions 22 to 43.

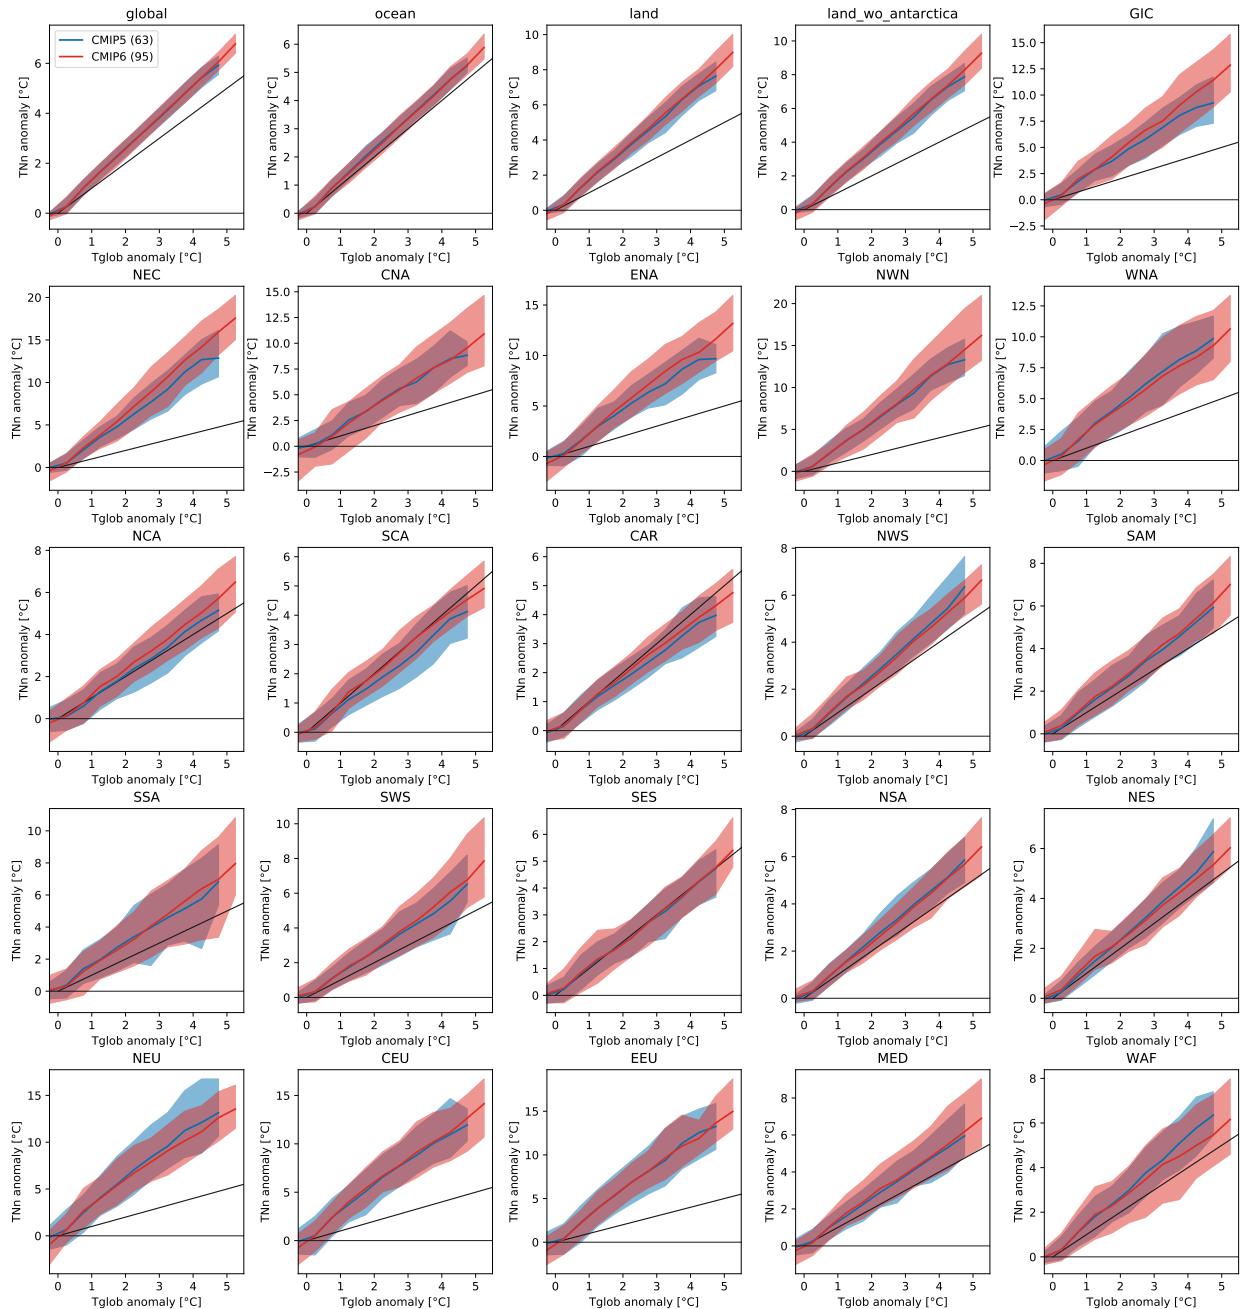

Figure S12: As Figure S8 but for T_{Nn} .

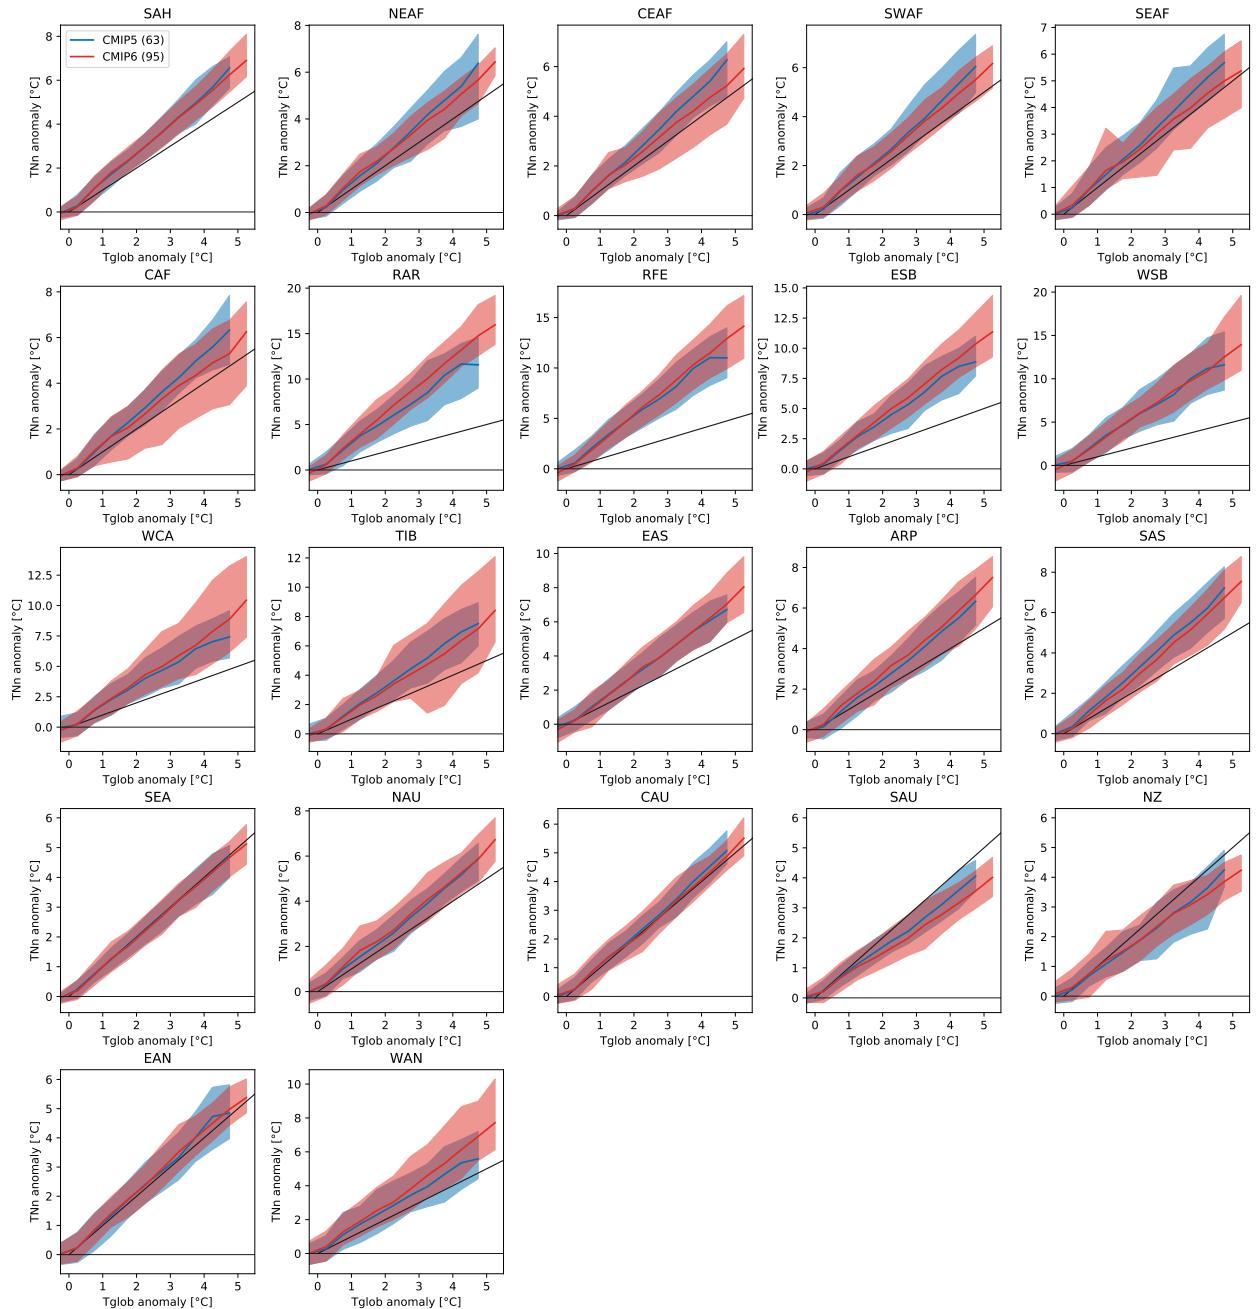

Figure S13: As Figure S12 for regions 22 to 43.

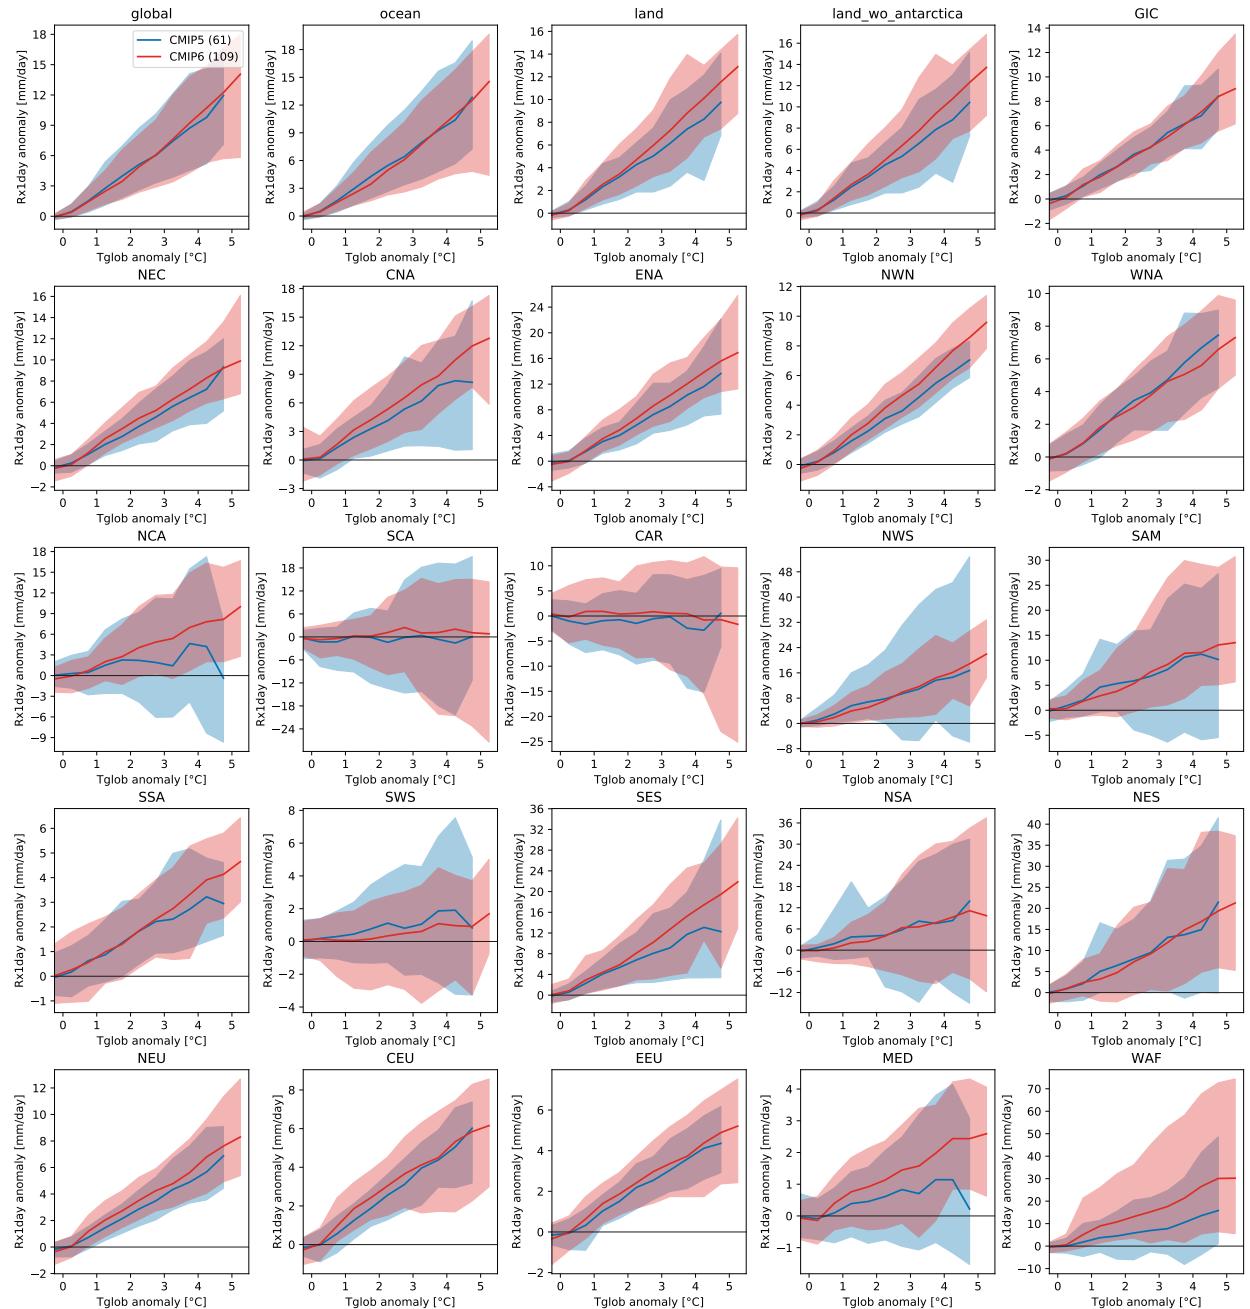

Figure S14: As Figure S8 but for Rx1day.

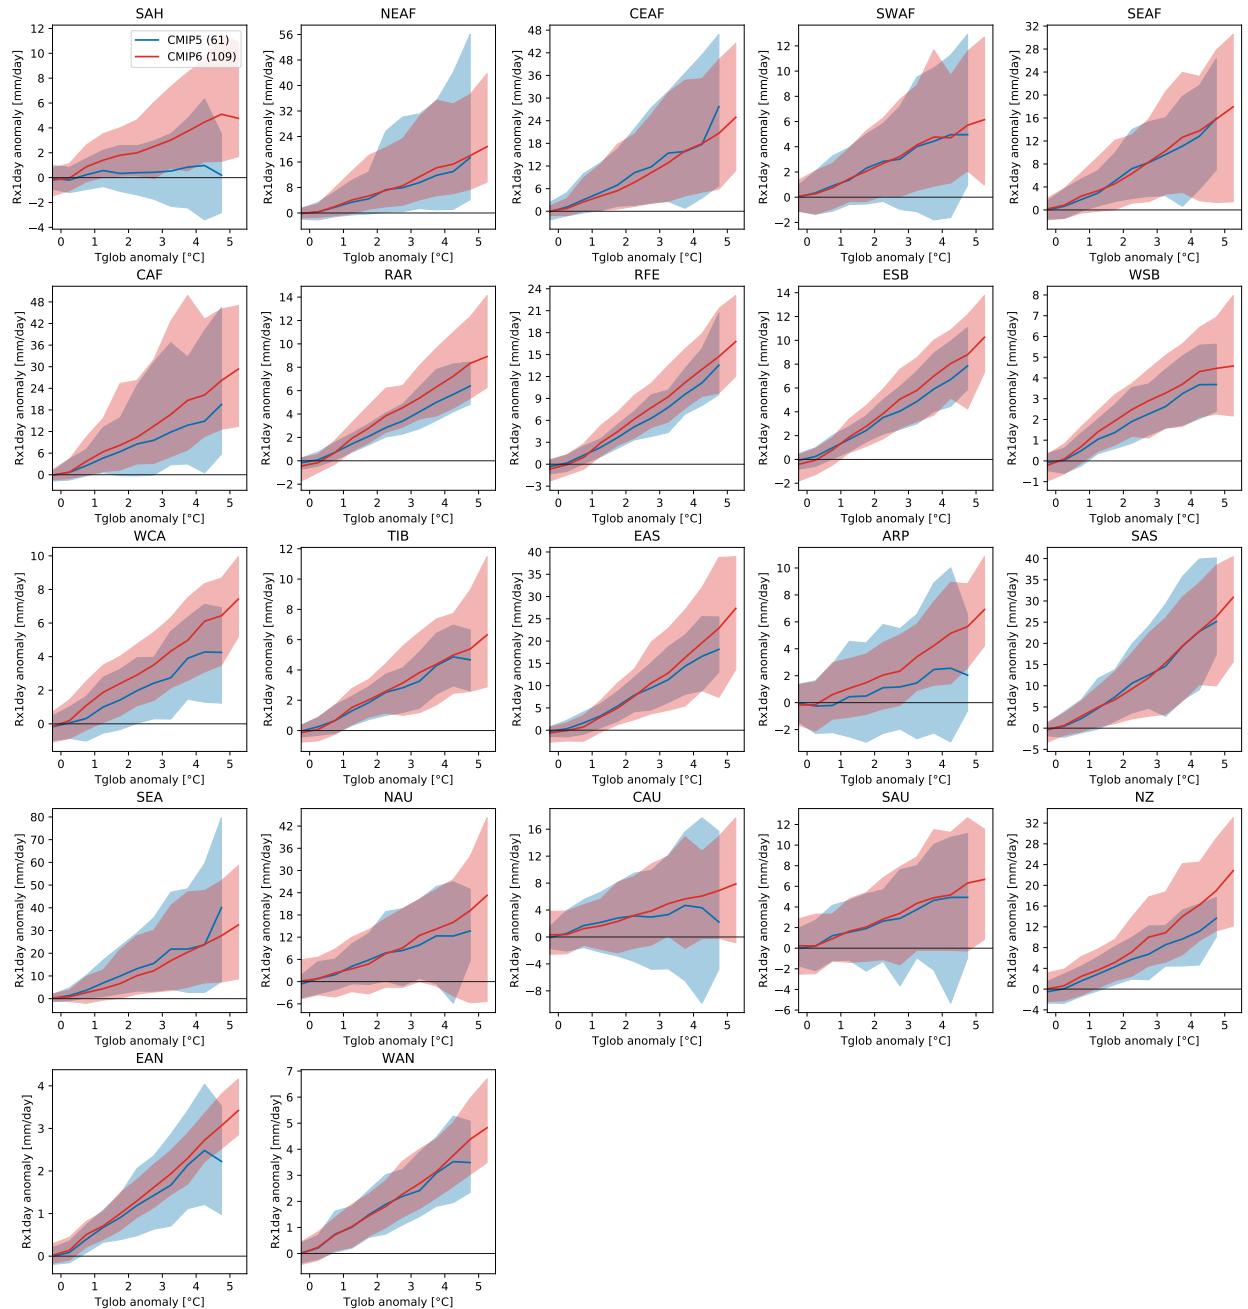

Figure S15: As Figure S14 for regions 22 to 43.

Additional tables

Table S1: Range (minimum and maximum; 5th and 95th percentile) and central values (mean and median) of TXx at a global mean warming of 1.5°C for CMIP5 and CMIP6 ensemble.
