

Supplementary Materials

Animal model

Pathogen-free 14-day pregnant C57BL/6J mice were purchased from Jackson Lab (USA). NASH-HCC was induced in male mice by a single subcutaneous injection of 200 µg STZ (Sigma, MO, USA) at 2 days after birth and feeding with HFD32 (CLEA Japan) ad libitum after 4 weeks of age. Male mice without any treatment, male mice treated with STZ alone and female mice treated with STZ-HFD were housed for control animals.

Liver samples were collected from male mice of five groups (4wks with STZ and then with HFD diet at 6 wks, 8wks, 12 wks and 20 wks) with their corresponding control groups. The number of mice per group per time point for gene and miRNA expression analyses was three, which gives a total of 30 samples.

Transcript and miRNA Sequencing and data analysis

30 liver RNA samples were shipped on dry ice to BGI@CHOP (Philadelphia, PA) for RNA-Seq and small RNA-Seq library preparation and analysis. Specifically, Illumina-HiSeq 4000 platform was used to sequence transcriptome (paired-end 100bp) while the Illumina-HiSeq 4000 platform for small RNA (single-end 50bp). Raw sequence data were deposited in the NCBI SAR database (SUB7793657, official ID pending). Read quality control checks were performed using FastQC [Babraham, 2017]. Adaptors, primers, ambiguous bases, and bases having quality scores less than 30 were removed by cutadapt [Martin, 2011].

RNA-Seq analysis was performed using RSEM and EBSeq for gene expression quantification. For miRNA, high quality reads in the range of 18 - 40 bps remained for annotation and expression estimation using miRDeep2, a small RNA sequencing analytical pipeline [Friedlander, 2012]. Particularly, the read sequences were mapped to reference sequences of mouse genome, known precursor and mature miRNA, and other types of non-coding RNAs. The miRNA expression levels identified for each library were normalized as transcripts per million (TPM) according to the following formula: TPM = (specific miRNA read count ×1,000,000) / total miRNA mapped reads.

Identification of differentially expressed miRNAs and Genes

For the pairwise comparison, *DESeq2* package was used to identify the differentially expressed (DE)- miRNAs and genes in each condition group versus respective control. A threshold of fold change ≥ 2 and P value ≤ 0.05 was employed to identify DE-gene and miRNAs. The table below shows the statistics from this analysis.

	DE	Genes	miRNAs
4wks	Up	384	23
	Down	612	79
6wks	Up	11	35
	Down	16	31
8wks	Up	701	46
	Down	114	69
12wks	Up	432	19
	Down	72	57
20wks	Up	652	70
	Down	201	108

Comparison with

We have conducted a peer comparison with two other well-established methods, RACER[1] and MCMG[2], on miRNA target prediction using expression data, to demonstrate the performance of our approach. The test dataset was collected from 332 Hepatocellular carcinoma (LIHC) patients, available at TCGA[3], along with 34,986 experimental miRNA-target interactions detected by CLEAR-CLIP[4] in Hepatocellular carcinoma cell (Huh-7.5). We utilized three methods to predict the miRNA-target interactions in each stage of LIHC. First, we found that RACER and MCMG predicted significant more interactions than miRDR (average number of predicted interactions: miRDR 1,634; RACER 10,371; MCMG 212,171) but less experimental validated interactions among the top ranked ones. When taking a close look at each stage, we ranked the predicted interactions from RACER and MCMG according to the score and compare with top-n predictions from miRDR at 100-intervals (Figure 1A). It is clear that miRDR outperformed two other methods by identifying significantly more validated interactions in each stage (p-value of one-sided Wilcoxon singed rank test is shown in the figure). Moreover, unlike RACER and MCMG, miRDR's performance was not affected by the input sample size. For example, RACER and MCMG predicted only half validated targets in smaller sets (in stage II (82), III (80) and IV (6)) than what they did in a bigger set (stage I (164)). At another evaluation, we compared the distribution of miRNA target count predicted by three methods, using the experimental data from CLEAR-CLIP as reference. As Figure 1B shows, the distribution of miRDR is very close to the experimental one, while RACER and MCMG tend to predict too many more targets for most miRNAs.

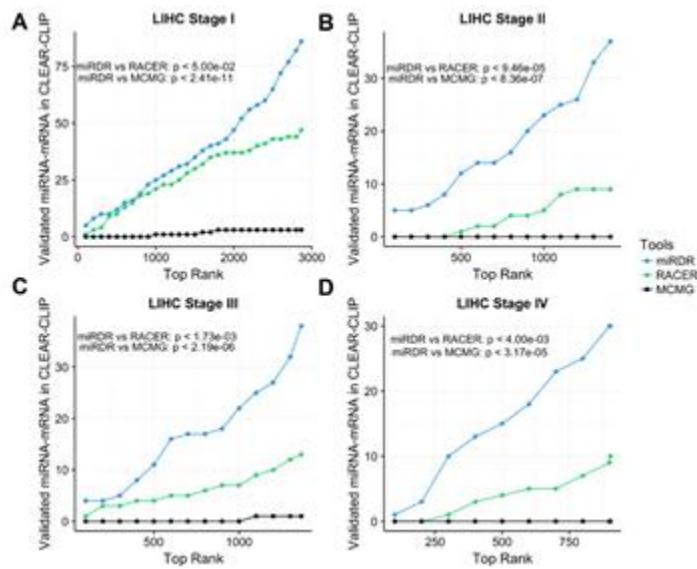

Figure 1A. Identified miRNA-target interactions identified by MiRDR, RACER and MCMG based on the Hepatocellular carcinoma (LIHC) data. The x-axis represents the top ranked interaction predicted by miRDR while the y-axis represents the count of validated interactions. The p-values were calculated by one-sided Wilcoxon singed rank test.

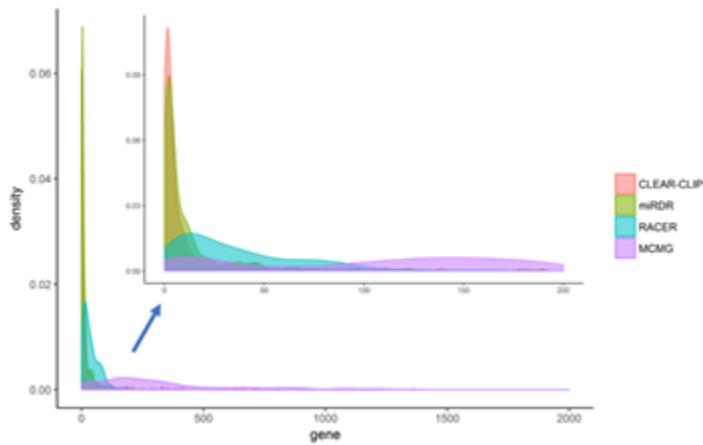

Figure 1B. Method comparison based on the counts of identified miRNA targets. X-axis: number of target genes; y-axis: miRNA percentage. Outer plot shows the overall distribution and the inner shows the zoom-in view of partial distribution in the range of [0, 200]

Through a comparison with two leading algorithms for miRNA target prediction based on expression profiles, miRDR has showed its advantageous predictive power with two major improvements. First, comparing with other methods, miRDR's predictions tend to include more validated interactions while not introducing significant high false prediction. This is an important aspect given the widely accepted critique on high false positive rate in current target prediction. Another advantage was the stable performance of miRDR on fairly limited sample size. The meta-analysis design minimized the impacts of sample variation on the target prediction, which seems promising to facilitate the detection of weak signals between miRNA and targets with insufficient samples.

Supplementary Table 1. The summary of differentially expressed genes and miRNAs, as well as miRNA-gene interactions detected in each disease condition.

	Obsity	KIRC	KIRP	LIHC	UCEC	BRCA	LUAD	LUSC
DE-Gene	405	4944	4660	3696	5599	4231	4426	6365
DE-miRNA	9	72	72	79	144	69	73	97
Detected gene-miRNA interactions	9,123	475	805	813	301	1,011	800	718

(The detailed list is provided at http://sbbi-panda.unl.edu/misc/obesity_prj_diff_genes.zip; the list is already filtered according to $|\log_2 FC| \leq 1$ and $pval \leq 0.05$)
