

Fig.S15 Identification of shared biomarkers between Paget and Paget-like cells. Selected common biomarkers shared between Paget-like and Paget cells (Log F.C. = 0.25X, 25% cell/cluster, Wilcox test, $P < 0.05$). Shared genes between Paget and Paget-like cells were identified by selecting all genes in each cluster, followed by manual comparison with each other. A total of 69 genes met this criterion and identified as 'shared' markers.
