

Supplemental Figure S6. Association of circulating cytokine levels with objective clinical response. Circulating plasma cytokines were measured from blood collected at (A) baseline, (B) post-CRT, and (C) post-ipilimumab using a multiplexing bead-based immunoassay. Levels of cytokines were correlated with overall clinical response. Box-plots show 25th to 75th percentiles with median value indicated by horizontal line. Whiskers indicate minimum and maximum values. CR= complete response; PR= partial response; SD= stable disease; PD=progressive disease. All comparisons were non-significant.
