Table S1. Real time PCR assays on the TaqMan Array Card used in MAL-ED.

All the assays have been described previously and extensively validated.¹⁻³ Nucleic acid was extracted with the QIAamp Fast DNA Stool mini kit (Qiagen, Hilden, Germany) with pre-treatment steps that included bead beating. AgPath One Step RT-PCR reagents were used for qPCR reactions, which were performed on ViiA 7 systems. Quantification cycles (Cqs) are the PCR cycle values at which fluorescence from amplification exceeds the background, which acts as an inverse metric of quantity of nucleic acid. Valid results required proper functioning of controls (the negative results of a sample are valid only when its external control MS2 is positive, $Cq \leq 35$; the positive results are valid only when the corresponding extraction blank is negative for the relevant targets, $Cq > 35$), and excluded data flagged by the real time PCR software, i.e. BADROX in combination with NOISE or SPIKE.

	Pathogen	Gene
Viruses	Adenovirus 40/41	Fiber gene
	Astrovirus	Capsid
	Norovirus GI/GII	GI ORF1-2 and GII ORF1-2
	Rotavirus	<i>NSP3</i>
	Sapovirus	<i>RdRp</i>
Bacteria	EAEC*	<i>aaiC</i> , <i>aatA</i> , <i>aggR</i>
	Atypical EPEC*	<i>eae</i>
	Typical EPEC*	<i>bfpA</i>
	ETEC*	<i>LT</i> , <i>STh</i> and <i>STp</i>
	STEC*	<i>stx1</i> , <i>stx2</i>
	<i>Aeromonas</i>	Aerolysin
	<i>Campylobacter spp.</i>	<i>cadF</i> and <i>cpn60</i>
	<i>Helicobacter pylori</i>	<i>ureC</i>
	<i>Plesiomonas shigelloides</i>	<i>gyrB</i>
	<i>Salmonella</i>	<i>ttr</i>
	<i>Shigella/EIEC†</i>	<i>ipaH</i>
	<i>Vibrio cholerae</i>	<i>hlyA</i>
	Fungi	<i>Enterocytozoon bieneusi</i>
<i>Encephalitozoon intestinalis</i>		SSU rRNA
Protozoa	<i>Cryptosporidium</i>	18S rRNA
	<i>Cyclospora cayetanensis</i>	18S rRNA
	<i>Cystoisospora belli</i>	18S rRNA
	<i>Entamoeba histolytica</i>	18S rRNA
	<i>Giardia</i>	18S rRNA
Helminth	<i>Ancylostoma duodenale</i>	<i>ITS2</i>
	<i>Ascaris lumbricoides</i>	<i>ITS1</i>
	<i>Necator americanus</i>	<i>ITS2</i>
	<i>Strongyloides stercoralis</i>	Dispersed repetitive sequence
	<i>Trichuris trichiura</i>	18S rRNA
Controls	MS2	<i>MS2g1</i>
	PhHV	<i>gB</i>

**E. coli* pathotypes were defined as follows: EAEC (*aaiC*, or *aatA*, or both), atypical EPEC (*eae* without *bfpA*, *stx1*, and *stx2*), typical EPEC (*bfpA*), ETEC (*STh*, *STp*, or *LT*), STEC (*eae* without *bfpA* and with *stx1*, *stx2*, or both).

†Both *Shigella* and enteroinvasive *E. coli* are detected using the *ipaH* target, however based on previous findings that *S. flexneri* and *S. sonnei* account for the majority of *ipaH* detections,² plus the finding that *Shigella* culture positive stools are metagenomically similar to *ipaH* positive stools,⁴ for simplicity we interpret *ipaH* detections as diagnostic of *Shigella*.

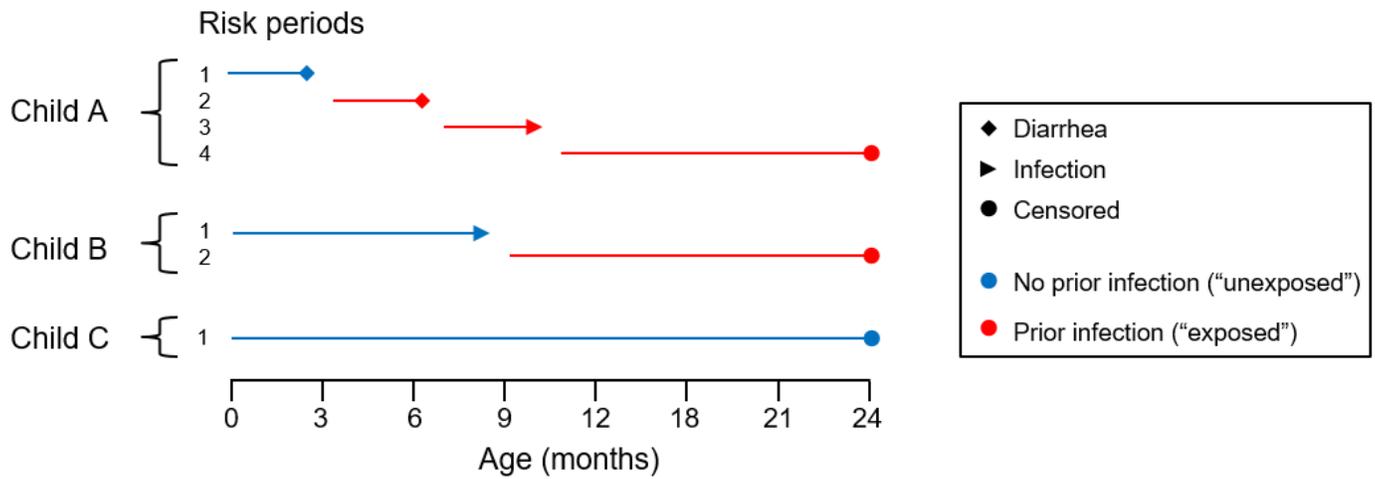

Figure S1. Conceptual diagram of the risk period formulation for example children A, B, and C in the Andersen and Gill extension of the Cox model. Each risk period is defined by birth or age at 21 days after a prior infection to age at subsequent outcome, and each child contributed multiple risk periods from birth to 2 years of age. This diagram was adapted from Kelly PJ and Lim LLY, 2000.⁵

Table S2. Estimates of protection against infection and attributable diarrhea due to one or two or more prior infections from the same pathogen in the MAL-ED cohort.

Pathogen	# previous infections	N	Infection outcome			Attributable diarrhea outcome				
			N (%) with subsequent infection	Unadjusted* HR (95% CI)	Adjusted† HR (95% CI)	Calibrated‡ HR (95% CI)	N (%) with subsequent diarrhea	Unadjusted* HR (95% CI)	Adjusted† HR (95% CI)	Calibrated‡ HR (95% CI)

*Hazard ratio adjusted for site

†Hazard ratio adjusted for site, SES, sex, enrollment WAZ, maternal education, maternal height, crowding, and exclusive breastfeeding in first 6 months

‡Hazard ratio adjusted for the same variables above and calibrated based on negative control estimates calculated across sites

§Not estimated if fewer than 10 total diarrhea episodes at the site

N. F., Pakistan = Naushero Feroze, Pakistan

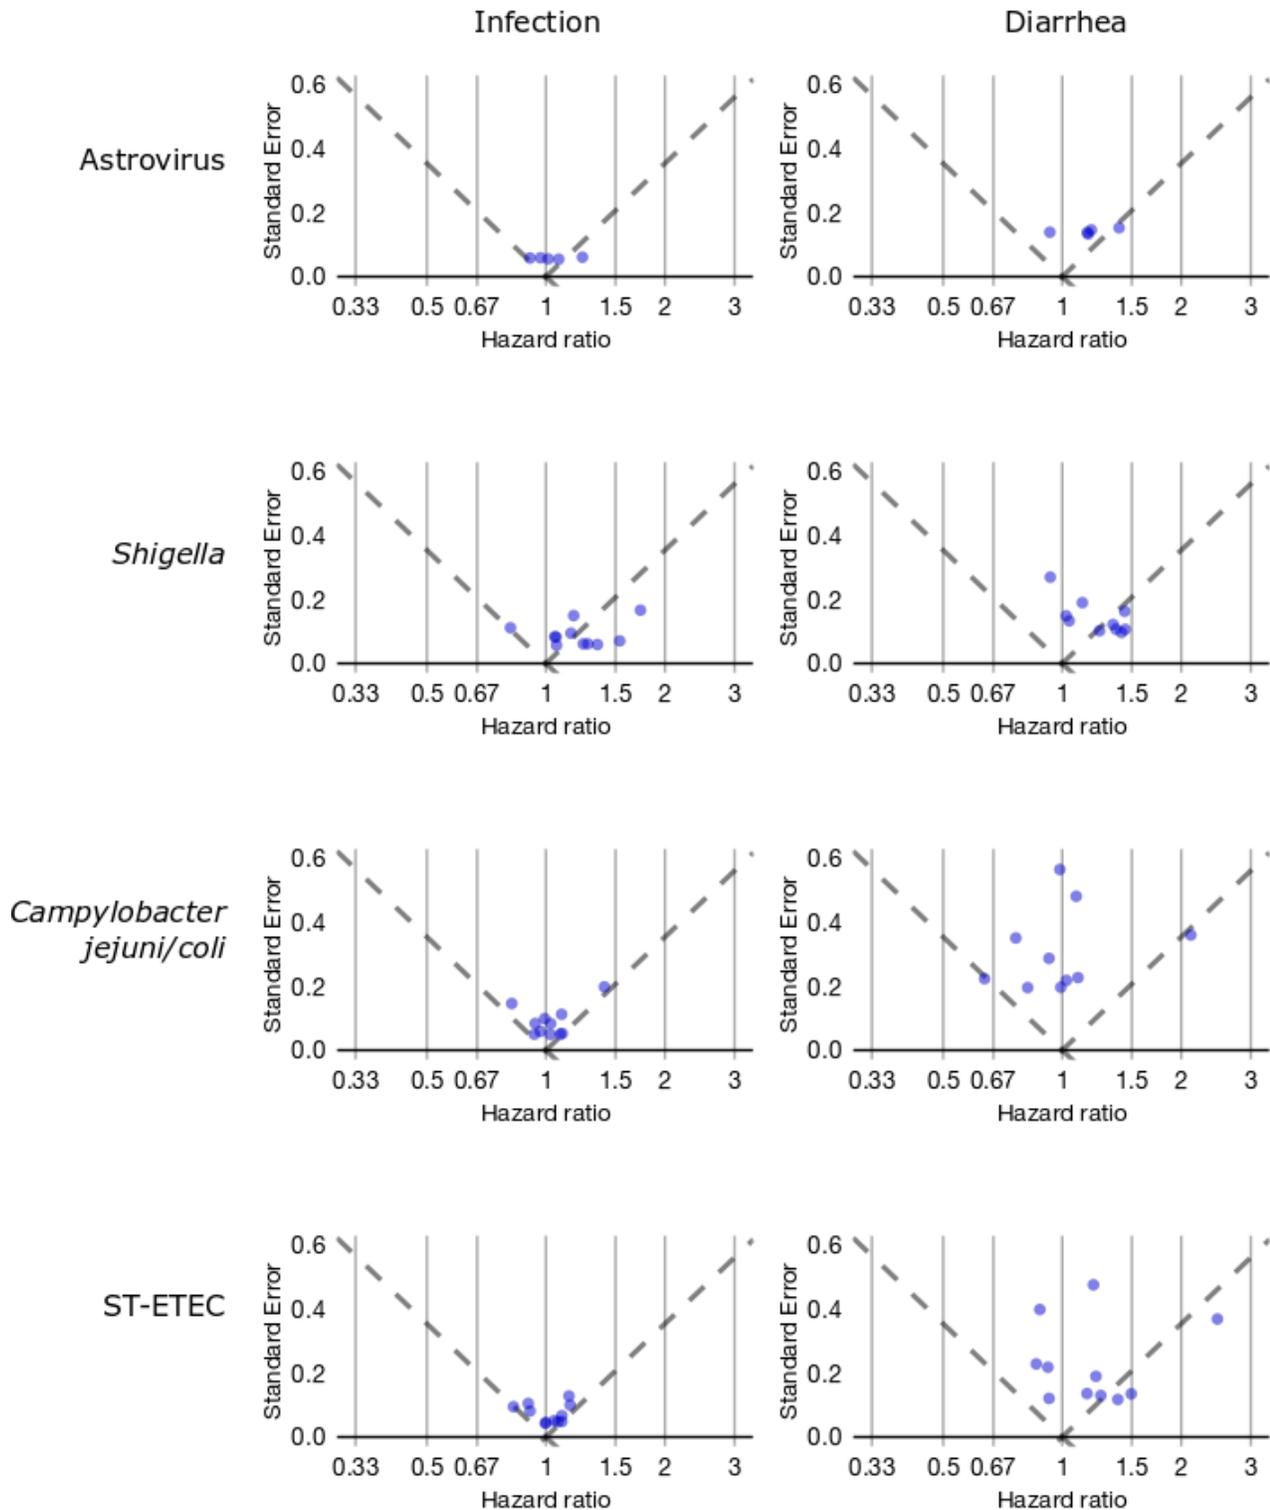

Figure S2. Funnel plots of the negative control estimates. Each dot represents one negative control association between 1+ prior infections with another pathogen of the same type (bacteria, viruses, parasites; i.e. a negative control pathogen) and subsequent infection or diarrhea due to the pathogen of interest (listed on left). Extreme estimates were excluded (hazard ratio < 0.001 or standard error \geq 0.8). For the expected null distribution, the negative control estimates are expected to be centered around a hazard ratio of 1 and 95% of the estimates are expected to lie between the two dotted gray lines. Deviations from this expected distribution indicate the direction and magnitude of systematic error.

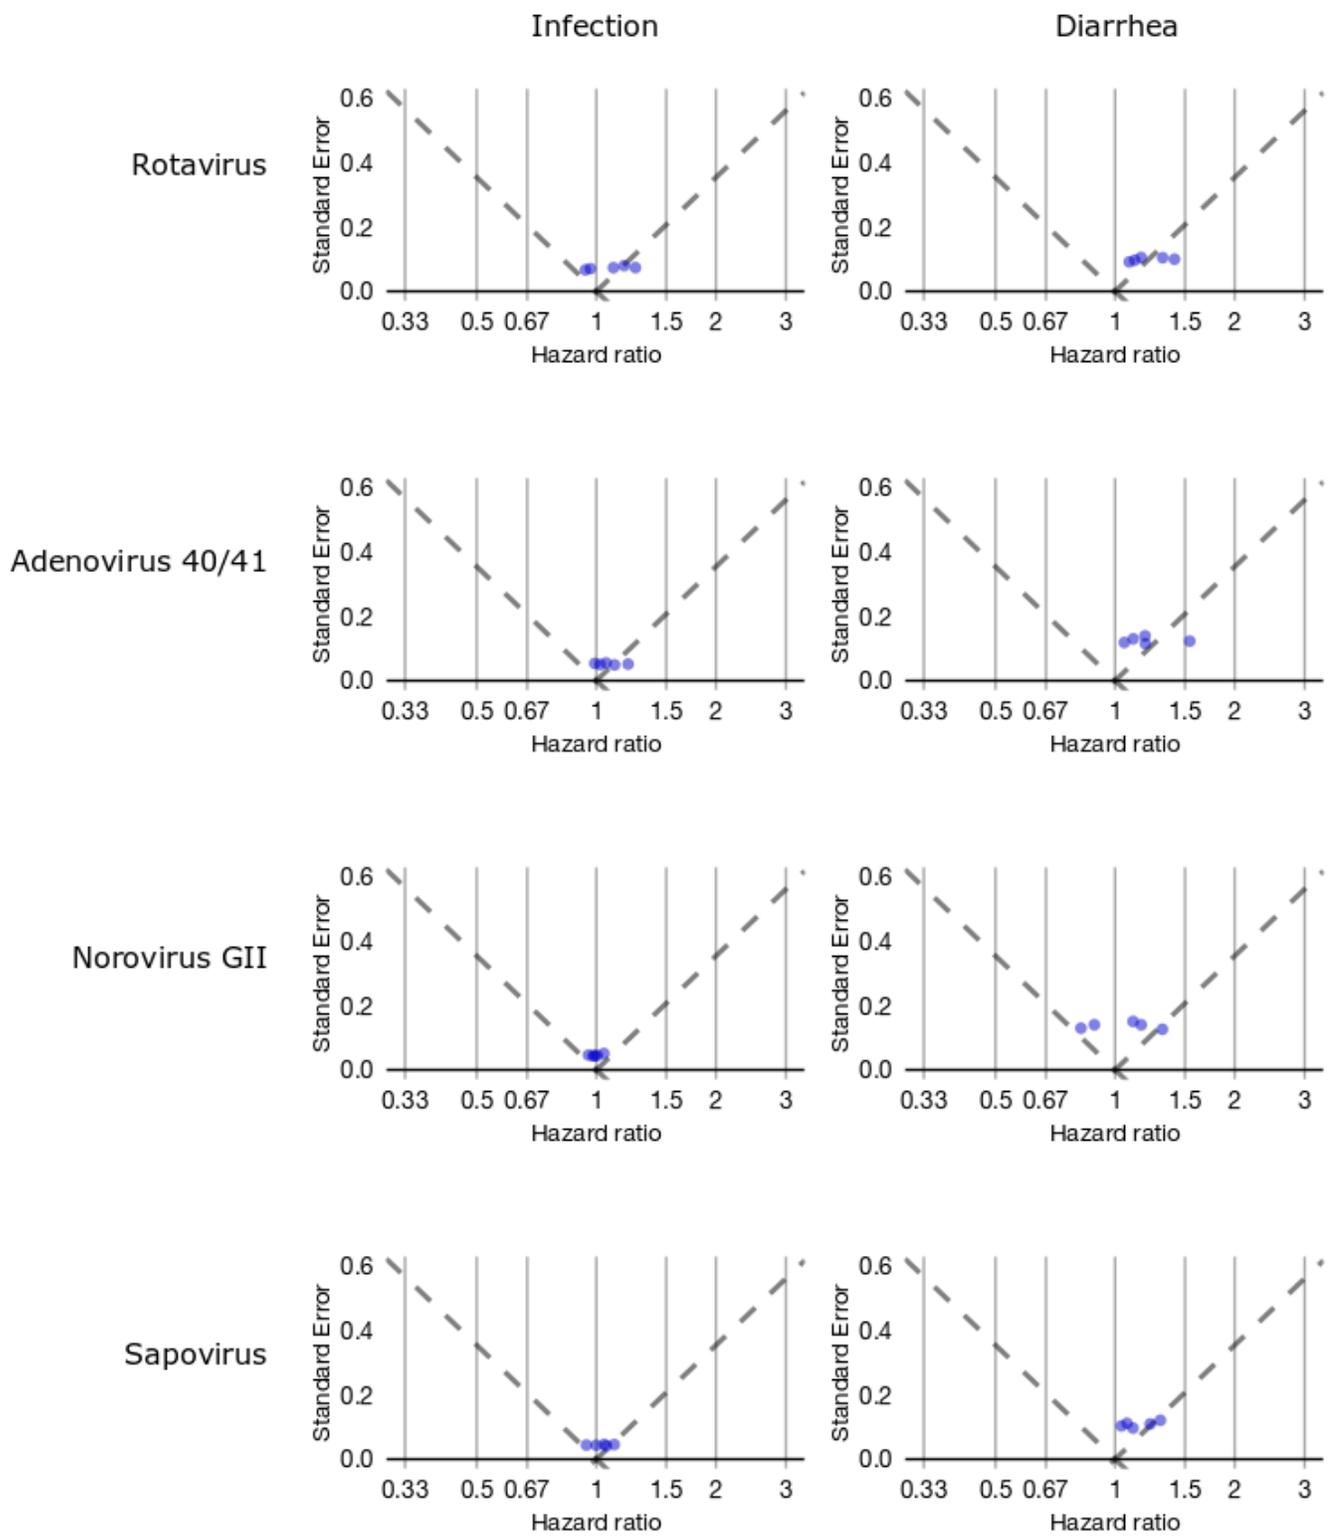

Figure S2 continued.

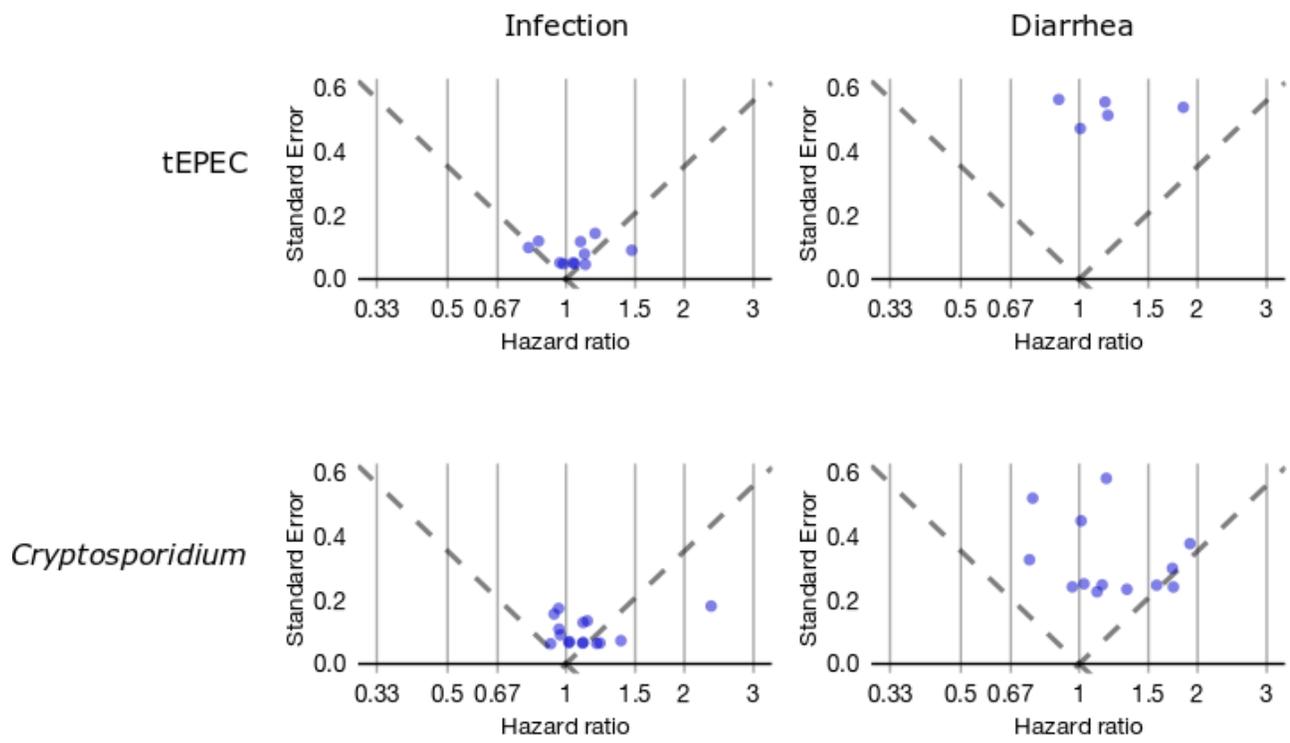

Figure S2 continued.

Sensitivity analyses

Table S5. Age-specific estimates of protection against infection and attributable diarrhea due to one or more prior infections from the same pathogen in the MAL-ED cohort.

Pathogen	Age (months)	# previous infections*	Infection outcome			Attributable diarrhea outcome			
			N	N (%) with subsequent infection	HR [†] (95% CI)	Calibrated [‡] HR (95% CI)	N (%) with subsequent diarrhea	HR [†] (95% CI)	Calibrated [‡] HR (95% CI)

*Hazard ratio adjusted for site, SES, sex, enrollment WAZ, maternal education, maternal height, crowding, and exclusive breastfeeding in first 6 months and calibrated based on negative controls of the same pathogen type (bacteria, viruses, and parasites).

†Hazard ratio adjusted for the same variables and calibrated based on negative controls of all pathogens.

Table S12. Estimates of protection comparing adjustment for pre-specified confounders (primary analysis), adjustment for pre-specified confounders and prior exposure to other pathogens (sensitivity analysis), and calibration with negative controls (primary analysis).

Pathogen	# previous infections	N	Infection outcome			Attributable diarrhea outcome				
			N (%) with subsequent infection	Primary analysis adjusted* HR (95% CI)	Other pathogen adjusted† HR (95% CI)	Calibrated‡ HR (95% CI)	N (%) with subsequent diarrhea	Primary analysis adjusted* HR (95% CI)	Other pathogen adjusted† HR (95% CI)	Calibrated‡ HR (95% CI)
