

Supplemental figure 1: CEA-specific ELISPOT responses in the first 6 patients. Patient sera or PBMCs were analyzed before and after VRP-CEA(6D) for each immunization by VRP-CEA and TRICOM-CEA IFN- γ ELISpot for the first six patients on study. Patient PBMCs were stimulated with VRP-CEA or TRICOM-CEA (MOI 10) in an ELISpot assay (previously described). The number of IFN- γ -producing cells per 10^6 PBMCs is presented as mean \pm SEM.
