CONSORT-EHEALTH (V 1.6.1) -Submission/Publication Form

The CONSORT-EHEALTH checklist is intended for authors of randomized trials evaluating web-based and Internet-based applications/interventions, including mobile interventions, electronic games (incl multiplayer games), social media, certain telehealth applications, and other interactive and/or networked electronic applications. Some of the items (e.g. all subitems under item 5 - description of the intervention) may also be applicable for other study designs.

The goal of the CONSORT EHEALTH checklist and guideline is to bea) a guide for reporting for authors of RCTs,b) to form a basis for appraisal of an ehealth trial (in terms of validity)

CONSORT-EHEALTH items/subitems are MANDATORY reporting items for studies published in the Journal of Medical Internet Research and other journals / scientific societies endorsing the checklist.

Items numbered 1., 2., 3., 4a., 4b etc are original CONSORT or CONSORT-NPT (nonpharmacologic treatment) items. Items with Roman numerals (i., ii, iii, iv etc.) are CONSORT-EHEALTH extensions/clarifications.

As the CONSORT-EHEALTH checklist is still considered in a formative stage, we would ask that you also RATE ON A SCALE OF 1-5 how important/useful you feel each item is FOR THE PURPOSE OF THE CHECKLIST and reporting guideline (optional).

Mandatory reporting items are marked with a red *.

In the textboxes, either copy & paste the relevant sections from your manuscript into this form - please include any quotes from your manuscript in QUOTATION MARKS, or answer directly by providing additional information not in the manuscript, or elaborating on why the item was not relevant for this study.

YOUR ANSWERS WILL BE PUBLISHED AS A SUPPLEMENTARY FILE TO YOUR PUBLICATION IN JMIR AND ARE CONSIDERED PART OF YOUR PUBLICATION (IF ACCEPTED). Please fill in these questions diligently. Information will not be copyedited, so please use proper spelling and grammar, use correct capitalization, and avoid abbreviations.

DO NOT FORGET TO SAVE AS PDF _AND_ CLICK THE SUBMIT BUTTON SO YOUR ANSWERS ARE IN OUR DATABASE !!!

Citation Suggestion (if you append the pdf as Appendix we suggest to cite this paper in the caption):

Title of your manuscript * Provide the (draft) title of your manuscript.

Can a behavioral smartphone application decrease sedentary behavior in cardiac rehabilitation participants?: the ToDo-CR feasibility study

Name of your App/Software/Intervention *

If there is a short and a long/alternate name, write the short name first and add the long name in brackets.

Vire app and ToDo-CR program

Evaluated Version (if any)

e.g. "V1", "Release 2017-03-01", "Version 2.0.27913"

Your answer

Language(s) *

What language is the intervention/app in? If multiple languages are available, separate by comma (e.g. "English, French")

English

URL of your Intervention Website or App

e.g. a direct link to the mobile app on app in appstore (itunes, Google Play), or URL of the website. If the intervention is a DVD or hardware, you can also link to an Amazon page.

Your answer

URL of an image/screenshot (optional)

Your answer

Accessibility *

Can an enduser access the intervention presently?

- access is free and open
- access only for special usergroups, not open
-) access is open to everyone, but requires payment/subscription/in-app purchases
-) app/intervention no longer accessible
-) Other:

Primary Medical Indication/Disease/Condition *

e.g. "Stress", "Diabetes", or define the target group in brackets after the condition, e.g. "Autism (Parents of children with)", "Alzheimers (Informal Caregivers of)"

Coronary heart disease

Primary Outcomes measured in trial *

comma-separated list of primary outcomes reported in the trial

objectively-measured daily minutes of sedenta

Secondary/other outcomes

Are there any other outcomes the intervention is expected to affect?

Your answer

Recommended "Dose" *

What do the instructions for users say on how often the app should be used?

\bigcirc	Approximately Daily
0	Approximately Weekly

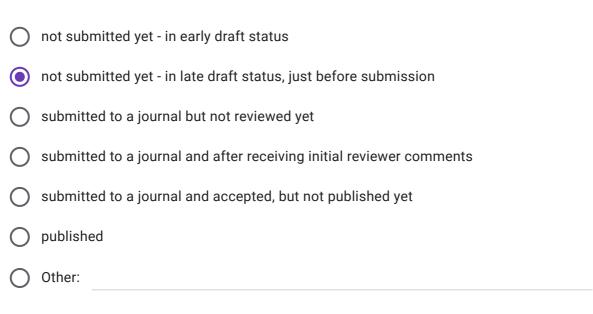

Other:

Approx. Percentage of Users (starters) still using the app as recommended after 3 months *
Inknown / not evaluated
0-10%
0 11-20%

Is this a full powered effectiveness trial or a pilot/feasibility trial? * Pilot/feasibility Fully powered
 Manuscript tracking number * If this is a JMIR submission, please provide the manuscript tracking number under "other" (The ms tracking number can be found in the submission acknowledgement email, or when you login as author in JMIR. If the paper is already published in JMIR, then the ms tracking number is the four-digit number at the end of the DOI, to be found at the bottom of each published article in JMIR) no ms number (yet) / not (yet) submitted to / published in JMIR Other:
TITLE AND ABSTRACT
1a) TITLE: Identification as a randomized trial in the title
1a) Does your paper address CONSORT item 1a? * I.e does the title contain the phrase "Randomized Controlled Trial"? (if not, explain the reason under "other")
 yes Other: this is a single cohort feasibility study

1a-i) Identify the mode of delivery in the title

Identify the mode of delivery. Preferably use "web-based" and/or "mobile" and/or "electronic game" in the title. Avoid ambiguous terms like "online", "virtual", "interactive". Use "Internet-based" only if Intervention includes non-web-based Internet components (e.g. email), use "computer-based" or "electronic" only if offline products are used. Use "virtual" only in the context of "virtual reality" (3-D worlds). Use "online" only in the context of "online support groups". Complement or substitute product names with broader terms for the class of products (such as "mobile" or "smart phone" instead of "iphone"), especially if the application runs on different platforms.

cardiac rehabilitation participants

1b) ABSTRACT: Structured summary of trial design, methods, results, and

conclusions

NPT extension: Description of experimental treatment, comparator, care providers, centers, and blinding status.

1b-i) Key features/functionalities/components of the intervention and

comparator in the METHODS section of the ABSTRACT

Mention key features/functionalities/components of the intervention and comparator in the abstract. If possible, also mention theories and principles used for designing the site. Keep in mind the needs of systematic reviewers and indexers by including important synonyms. (Note: Only report in the abstract what the main paper is reporting. If this information is missing from the main body of text, consider adding it)

	1	2	3	4	5	
subitem not at all important	0	0	0	0	0	essential

Does your paper address subitem 1b-i?*

Copy and paste relevant sections from the manuscript abstract (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

Using a single-center pre-post design, participants were recruited by nursing staff on-entry into cardiac rehabilitation. All eligible participant's installed the Vire app, were given a Fitbit Flex and received the 6-week ToDo-CR program while attending cardiac rehabilitation. The ToDo-CR program uses personalized analytics to interpret important behavioral aspects (physical activity, situational context and social opportunity). The program uses real-time information for generating and suggesting context specific actionable micro behaviors (Do's).

1b-ii) Level of human involvement in the METHODS section of the ABSTRACT

Clarify the level of human involvement in the abstract, e.g., use phrases like "fully automated" vs. "therapist/nurse/care provider/physician-assisted" (mention number and expertise of providers involved, if any). (Note: Only report in the abstract what the main paper is reporting. If this information is missing from the main body of text, consider adding it)

	1	2	3	4	5	
subitem not at all important	0	0	0	0	0	essential

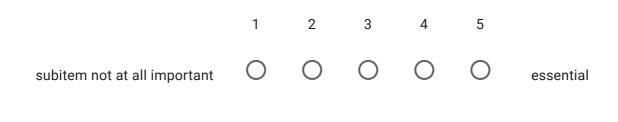

Does your paper address subitem 1b-ii?

Copy and paste relevant sections from the manuscript abstract (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

Using a single-center pre-post design, participants were recruited by nursing staff on-entry into cardiac rehabilitation.

1b-iii) Open vs. closed, web-based (self-assessment) vs. face-to-face assessments in the METHODS section of the ABSTRACT

Mention how participants were recruited (online vs. offline), e.g., from an open access website or from a clinic or a closed online user group (closed usergroup trial), and clarify if this was a purely web-based trial, or there were face-to-face components (as part of the intervention or for assessment). Clearly say if outcomes were self-assessed through questionnaires (as common in web-based trials). Note: In traditional offline trials, an open trial (open-label trial) is a type of clinical trial in which both the researchers and participants know which treatment is being administered. To avoid confusion, use "blinded" or "unblinded" to indicated the level of blinding instead of "open", as "open" in web-based trials usually refers to "open access" (i.e. participants can self-enrol). (Note: Only report in the abstract what the main paper is reporting. If this information is missing from the main body of text, consider adding it)

Does your paper address subitem 1b-iii?

Copy and paste relevant sections from the manuscript abstract (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

Using a single-center pre-post design, participants were recruited by nursing staff on-entry into cardiac rehabilitation. All eligible participant's installed the Vire app, were given a Fitbit Flex and received the 6-week ToDo-CR program while attending cardiac rehabilitation. Outcome measures were collected at 0, 6 and 16-weeks. Assessors were not blinded. Feasibility outcomes included recruitment and follow-up rates, resource requirements, app usability (UTAUT2 questionnaire) and efficacy to detect a change in objectively-measured daily minutes of sedentary behavior (ActiGraph ActiSleep). Secondary outcomes included functional aerobic capacity (6-minute walk test), quality-of-life (MacNew questionnaire), anxiety and depression (Hospital Anxiety and Depression Scale questionnaire), body mass index, waist circumference, waist-to-hip ratio, blood pressure and self-reported sedentary behavior (Past-day Adults Sedentary Time questionnaire) and physical activity (Active Australia Survey).

1b-iv) RESULTS section in abstract must contain use data

Report number of participants enrolled/assessed in each group, the use/uptake of the intervention (e.g., attrition/adherence metrics, use over time, number of logins etc.), in addition to primary/secondary outcomes. (Note: Only report in the abstract what the main paper is reporting. If this information is missing from the main body of text, consider adding it)

	1	2	3	4	5	
subitem not at all important	0	0	0	0	0	essential

Does your paper address subitem 1b-iv?

Copy and paste relevant sections from the manuscript abstract (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

Between January to May 2019, 20 participants were consecutively recruited. One third of people commencing cardiac rehabilitation were eligible to participate. Other than declining to take part in the study (38%), not having a smartphone was a major reason for exclusion (28%). Those excluded without a smartphone were significantly older than participants with a smartphone (mean difference 20 years, p<0.001). Participants were on average 55 years old, mostly male (85%) and working (67%). At 6-weeks 95% of participants were assessed, and 60% of participants were assessed at 16-weeks. Participants were relatively satisfied with the usability of the app (UTAUT2 questionnaire). Objectively-measured daily minutes of sedentary behavior did not change significantly over the study period, and participants spent 11-12 hours per day sitting. Although, there was a non-significant decrease in percentage of the day spent sitting at 16-weeks, with a small effect size (68.2% vs 65.7%, p=0.147, Cohen's d=0.33).

1b-v) CONCLUSIONS/DISCUSSION in abstract for negative trials

Conclusions/Discussions in abstract for negative trials: Discuss the primary outcome - if the trial is negative (primary outcome not changed), and the intervention was not used, discuss whether negative results are attributable to lack of uptake and discuss reasons. (Note: Only report in the abstract what the main paper is reporting. If this information is missing from the main body of text, consider adding it)

	1	2	3	4	5	
subitem not at all important	0	0	0	0	0	essential

Does your paper address subitem 1b-v?

Copy and paste relevant sections from the manuscript abstract (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

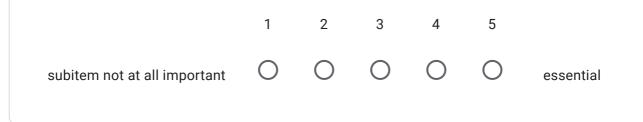

The use of a behavioral smartphone app to decrease sitting time appears to be feasible in cardiac rehabilitation. A larger randomized controlled trial is warranted.

INTRODUCTION

2a) In INTRODUCTION: Scientific background and explanation of rationale

2a-i) Problem and the type of system/solution

Describe the problem and the type of system/solution that is object of the study: intended as stand-alone intervention vs. incorporated in broader health care program? Intended for a particular patient population? Goals of the intervention, e.g., being more cost-effective to other interventions, replace or complement other solutions? (Note: Details about the intervention are provided in "Methods" under 5)

Does your paper address subitem 2a-i?*

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

With high levels of sedentary behavior reported in cardiac rehabilitation participants and low levels of physical activity, new initiatives are needed to improve the effectiveness of cardiac rehabilitation programs to address these behaviors. There is some evidence that smartphone applications are able to modify heart disease risk factors in cardiac rehabilitation populations [18-20] and interventions using computer, mobile and wearable technologies can be effective in reducing sedentary behavior but the evidence is limited

2a-ii) Scientific background, rationale: What is known about the (type of) system

Scientific background, rationale: What is known about the (type of) system that is the object of the study (be sure to discuss the use of similar systems for other conditions/diagnoses, if appropiate), motivation for the study, i.e. what are the reasons for and what is the context for this specific study, from which stakeholder viewpoint is the study performed, potential impact of findings [2]. Briefly justify the choice of the comparator.

2b) In INTRODUCTION: Specific objectives or hypotheses

Does your paper address CONSORT subitem 2b? *

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

The main aim of this feasibility study is to run a feasibility study as a precursor for a larger randomized controlled study to determine if the behavioral smartphone app (Vire) and online behavior change program (ToDo-CR) is feasible and likely to decrease sedentary behavior in cardiac rehabilitation participants [22]. The research questions were:

1. is the behavioral smartphone app (Vire) and online behavior change program (ToDo-CR) feasible in cardiac rehabilitation

2. is the behavioral smartphone app (Vire) and online behavior change program (ToDo-CR) likely to decrease objectively-measured sedentary behavior in cardiac rehabilitation participants.

METHODS

3a) Description of trial design (such as parallel, factorial) including allocation ratio

Does your paper address CONSORT subitem 3a? *

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

The feasibility study was a single-center pre-post design conducted over 16-weeks at the Canberra Hospital (Australia) cardiac rehabilitation program.

3b) Important changes to methods after trial commencement (such as eligibility criteria), with reasons

Does your paper address CONSORT subitem 3b? *

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

Yes. See below.

3b-i) Bug fixes, Downtimes, Content Changes

Bug fixes, Downtimes, Content Changes: ehealth systems are often dynamic systems. A description of changes to methods therefore also includes important changes made on the intervention or comparator during the trial (e.g., major bug fixes or changes in the functionality or content) (5-iii) and other "unexpected events" that may have influenced study design such as staff changes, system failures/downtimes, etc. [2].

	1	2	3	4	5	
subitem not at all important	0	0	0	0	0	essential

Does your paper address subitem 3b-i?

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

During the study period, five updates were performed to improve location tracking and the functionality of the app. The content of the Do's and analysis of the behavioral variables did not change during the study period.

4a) Eligibility criteria for participants

Does your paper address CONSORT subitem 4a? *

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

Your answer

4a-i) Computer / Internet literacy Computer / Internet literacy is often an implicit "de facto" eligibility criterion - this should be explicitly clarified. 1 2 3 4 5

subitem not at all important	0	0	0	0	0	essential

Does your paper address subitem 4a-i?

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

Eligible participants were aged \geq 18 years old, were currently enrolled in the cardiac rehabilitation program and had a smartphone.

4a-ii) Open vs. closed, web-based vs. face-to-face assessments:

Open vs. closed, web-based vs. face-to-face assessments: Mention how participants were recruited (online vs. offline), e.g., from an open access website or from a clinic, and clarify if this was a purely webbased trial, or there were face-to-face components (as part of the intervention or for assessment), i.e., to what degree got the study team to know the participant. In online-only trials, clarify if participants were quasi-anonymous and whether having multiple identities was possible or whether technical or logistical measures (e.g., cookies, email confirmation, phone calls) were used to detect/prevent these.

To access the Vire app, participants needed to use a study specific login code.

5-viii) Mode of delivery, features/functionalities/components of the intervention and comparator, and the theoretical framework

Describe mode of delivery, features/functionalities/components of the intervention and comparator, and the theoretical framework [6] used to design them (instructional strategy [1], behaviour change techniques, persuasive features, etc., see e.g., [7, 8] for terminology). This includes an in-depth description of the content (including where it is coming from and who developed it) [1]," whether [and how] it is tailored to individual circumstances and allows users to track their progress and receive feedback" [6]. This also includes a description of communication delivery channels and – if computer-mediated communication is a component – whether communication was synchronous or asynchronous [6]. It also includes information on presentation strategies [1], including page design principles, average amount of text on pages, presence of hyperlinks to other resources, etc. [1].

ToDo is a cloud-based behavior change program delivered through a smartphone app (Vire) created by Onmi in collaboration with Do Something Different Limited [23, 24]. The Vire app has been progressively developed over the course of several projects together with end-users and health care professionals [23]. The Vire app was available in both iOS and Android versions. The ToDo program aims to improve an individual's behavioral flexibility, learning new behaviors so they have more choice over how they react to different situations [25]. The program suggests micro behavioral alternatives that gradually change people's habits, with some evidence that these small behavioral changes, which may not directly target the habit of interest, effect health outcomes such as decreases in weight [23, 25]. The original program has been adapted by the research team to target sedentary behavior, based on Australian physical activity and cardiac rehabilitation guidelines to create ToDo-CR (Figure 1) [2, 26]. By combining technology, evidence-based guidelines and psychology, the ToDo-CR program aims to increase the participant's self-efficacy, behavioral flexibility and decrease their sitting time.

The ToDo-CR program is personalized and consists of different types of Do's delivered through the smartphone app via push notifications: Core Do's and Data Driven Do's. Core Do's address the individual's existing habits that often prevent healthy changes. Data is used from a questionnaire completed within the app at the start of the program asking questions about risk factors and desired behaviors, for example, how often do you spend most evenings watching TV or in front of a screen?, determining the Core Do's that are distributed. Data Driven Do's address the individuals everyday context that traps them in habitual behavior, combining data from the Fitbit Flex (activity data) and the Vire app (global positioning system, GPS) to create a comprehensive digital profile of the individual. Real time analysis algorithms use the GPS and activity data to calculate scores in three main variables: physical activity, social opportunity and variety (Figure 1A-D). Physical activity measures steps per day and the amount of time spent being active (Figure 1B). Social opportunity uses GPS coordinates to extract the number of new places visited and the amount of time spent in these places combining these two parameters to estimate the chances of meeting people (Figure 1C). Variety uses GPS coordinates as well as activity data, including uncommon places visited, the distance travelled, the routes taken, and the order and time at which places are visited, analyzing how much the individual's day differs from an average day (Figure 1D). For all variables, a baseline assessment is conducted for one week at the start of the program to understand a person's routine and activity capabilities. The baseline computation includes an assessment of the minimum and maximum value recorded during the week. Parameters are then linearly rescaled in a 0-10 range using the information collected in the baseline assessment (minimum and maximum value). The '0' value is assigned to the daily values that are equal or below the minimum and the '10' is assigned to the daily values that are equal or exceed the maximum value registered during the baseline period. The scores for each variable are made relative to each participant and the 0-10 range represents different levels of activity. Therefore, individuals are only prompted to make relative improvements, not to reach absolute levels. Scores for each variable are represented by the size of the circle on the home page (Figure 1A) and in the 14-day overview (Figure 1F). The bigger the circle, the higher the score, indicating a greater change from the individual's baseline measures.

The Data Driven Do's within the ToDo-CR program are dispatched based on these measurable variables or habits. Before sending any Data Driven Do's the program checks intraday data to ensure the analysis represents the day sufficiently, that is, data must represent more than 60% of the total available data to be considered precise enough to dispatch a Do. The system logs were continuously monitored through automated methods and manually for errors. When the participant scores were low on 3 consecutive days, an individualised, context-specific Data Driven Do was sent to stimulate the participant to improve their score and behaviour, and provided an opportunity for participants to mark the Do as completed (Figure 1E). Participants received feedback on their daily variable scores within the 14-day overview by receiving sad, neutral or smiley faces and can observe trends (Figure 1F). In total, there were 89 different Do's that could be dispatched to individuals depending on their individualized data, a combination of Core and Data Driven Do's. One third of the Do's targeted decreasing sedentary behavior and increasing physical activity (30/89). The maximum number of Do's received by participants per week was 3, with participants receiving 14-19 individualized Do's. Some of the Do's contained hyperlinks to other resources such as the Australian Heart Foundation website [27].

5-ix) Describe use parameters

Describe use parameters (e.g., intended "doses" and optimal timing for use). Clarify what instructions or recommendations were given to the user, e.g., regarding timing, frequency, heaviness of use, if any, or was the intervention used ad libitum.

The maximum number of Do's received by participants per week was 3, with participants receiving 14-19 individualized Do's.

5-x) Clarify the level of human involvement

Clarify the level of human involvement (care providers or health professionals, also technical assistance) in the e-intervention or as co-intervention (detail number and expertise of professionals involved, if any, as well as "type of assistance offered, the timing and frequency of the support, how it is initiated, and the medium by which the assistance is delivered". It may be necessary to distinguish between the level of human involvement required for the trial, and the level of human involvement required for a routine application outside of a RCT setting (discuss under item 21 – generalizability).

	1	2	3	4	5	
subitem not at all important	0	0	0	0	0	essential

Does your paper address subitem 5-x?

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

Resource Requirements

All participants installed the app, were given a Fitbit and received the 6-week ToDo-CR program. Participants required much more support than expected to install the app, link the app to the Fitbit app and to trouble-shoot any issues with the app and Fitbit. The Vire app did require updating in the initial stages of the study and this caused some issues. Consequently, written material was developed to support this and an FAQs button was added to the app. The research assistant also called all participants within the first week of commencing the study to determine if they were having any issues with the app, and provided advice and support accordingly.

5-xi) Report any prompts/reminders used

Report any prompts/reminders used: Clarify if there were prompts (letters, emails, phone calls, SMS) to use the application, what triggered them, frequency etc. It may be necessary to distinguish between the level of prompts/reminders required for the trial, and the level of prompts/reminders for a routine application outside of a RCT setting (discuss under item 21 – generalizability).

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

The maximum number of Do's received by participants per week was 3, with participants receiving 14-19 individualized Do's.

5-xii) Describe any co-interventions (incl. training/support)

Describe any co-interventions (incl. training/support): Clearly state any interventions that are provided in addition to the targeted eHealth intervention, as ehealth intervention may not be designed as stand-alone intervention. This includes training sessions and support [1]. It may be necessary to distinguish between the level of training required for the trial, and the level of training for a routine application outside of a RCT setting (discuss under item 21 – generalizability.

Your answer

17a-i) Presentation of process outcomes such as metrics of use and intensity of

use

In addition to primary/secondary (clinical) outcomes, the presentation of process outcomes such as metrics of use and intensity of use (dose, exposure) and their operational definitions is critical. This does not only refer to metrics of attrition (13-b) (often a binary variable), but also to more continuous exposure metrics such as "average session length". These must be accompanied by a technical description how a metric like a "session" is defined (e.g., timeout after idle time) [1] (report under item 6a).

Resource Requirements

All participants installed the app, were given a Fitbit and received the 6-week ToDo-CR program. Participants required much more support than expected to install the app, link the app to the Fitbit app and to trouble-shoot any issues with the app and Fitbit. The Vire app did require updating in the initial stages of the study and this caused some issues. Consequently, written material was developed to support this and an FAQs button was added to the app. The research assistant also called all participants within the first week of commencing the study to determine if they were having any issues with the app, and provided advice and support accordingly. In addition, during recruitment some nursing staff were unsure about introducing the app to potential participants and checking whether or not the smartphones of potential participants had suitable operating systems to be eligible for the study. Simplified written material and instructions on downloading the Fitbit app were developed to aid nursing staff and to ensure the recruitment process was as efficient as possible to decrease the impact it had on their clinical services.

DISCUSSION

22) Interpretation consistent with results, balancing benefits and harms, and considering other relevant evidence

NPT: In addition, take into account the choice of the comparator, lack of or partial blinding, and unequal expertise of care providers or centers in each group

Principal results

The use of a behavioral smartphone app (Vire) and an online behavior change program (ToDo-CR) to decrease sitting time appears feasible in cardiac rehabilitation and may reduce sedentary behavior over time. To our knowledge, this is the first study to report the effects of a behavioral smartphone app and an online behavior change program on objectively-measured sedentary behavior in cardiac rehabilitation. However, consideration must be given to the number of participants who did not have a smartphone within cardiac rehabilitation. Additionally, a smartphone app-based intervention may be more suited to younger cardiac rehabilitation participants. Despite this, even those with a smartphone required support with downloading the app and using the Fitbit, indicating additional support (written materials, telephone support) may be required when implementing a smartphone app-based intervention within this population.

there is some indication that mHealth interventions, including smartphone apps, can reduce objectively-measured sedentary behavior suggesting further investigation of this type of intervention in various populations is indicated.

this program is based on a behavior change framework, although a longer program may be necessary to result in changes in sedentary behavior and further investigation of the potential behavior change mechanism is required.

20) Trial limitations, addressing sources of potential bias, imprecision, and, if relevant, multiplicity of analyses

20-i) Typical limitations in ehealth trials

Typical limitations in ehealth trials: Participants in ehealth trials are rarely blinded. Ehealth trials often look at a multiplicity of outcomes, increasing risk for a Type I error. Discuss biases due to non-use of the intervention/usability issues, biases through informed consent procedures, unexpected events.

Limitations

There are several strengths of this study including the use of a personalized smartphone behavior change program based on real-time data analysis and clinical guidelines, the objective-measurement of sedentary behavior and the collection of data to inform a larger scale randomized controlled trial. There are also several weaknesses. As this was a feasibility study, the sample size was small, and the results should be interpreted with caution. This was also a single-center study where the majority of participants were men, limiting the generalizability of the results within cardiac rehabilitation settings. The ability to detect a significant change in sedentary behavior may have been limited by the small sample size. The attrition rate was high at 16-weeks, although this is commonly reported in app studies targeting management of disease risk factors and long term conditions [13]. Additionally, using the last value carried forward for the intention-to-treat analysis may not have been the most appropriate approach to use in this type of research [44]. Finally, as this was a single cohort study, the detected small effect size in reducing sedentary behavior over 16-weeks may not have been related to the ToDo-CR behavior change program.

21) Generalisability (external validity, applicability) of the trial findings

NPT: External validity of the trial findings according to the intervention, comparators, patients, and care providers or centers involved in the trial

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

This was also a single-center study where the majority of participants were men, limiting the generalizability of the results within cardiac rehabilitation settings.

21-ii) Discuss if there were elements in the RCT that would be different in a

routine application setting

Discuss if there were elements in the RCT that would be different in a routine application setting (e.g., prompts/reminders, more human involvement, training sessions or other co-interventions) and what impact the omission of these elements could have on use, adoption, or outcomes if the intervention is applied outside of a RCT setting.
