Supplementary Materials

Figure S1. NMR Spectrum of phi29 gp16 (208-332). (A) The ¹H-¹⁵N HSQC of the phi29 gp16 (208-332) with backbone peaks labeled by residue number. The tryptophan side chain epsilon proton-nitrogen pair is also labeled. **(B)** Inset of the HSQC from the boxed region in (A). This region illustrates the extra peaks from the N-terminal tail described in the text. **(C)** An HSQC collected on an older gp16 sample. The region of the HSQC is the same shown in (B).

Figure S2. Backbone Dynamics of phi29 gp16 (208-332). (A) Heteronuclear NOE (hnNOE) of the CTD-L. This data is sensitive to fast time scale motions (ps-ns) with rigidity increasing with increasing hnNOE values. A hnNOE value < 0.65 is considered to be flexible. **(B)** Relaxation data from the CTD-L. Higher than average spin-spin relaxation rates (R_2) are indicative substantial signal broadening caused by exchanging structural states on NMR timescale (µs-ms). Residues in secondary structure elements are indicated by blue arrows (β -sheets) and red bars (α -helix) at the top of the figure.

Figure S3. Backbone Dynamics of phi29 gp16 (223-332). (A) Heteronuclear NOE (hnNOE) of the CTD. (B) Relaxation data from the CTD. The data collectively highlight the flexibility of the N- and C-terminal tails, as well as the dynamics of the flexible loop between the 4th β -strand and the 1st α -helix (residues 282-296). (C) The 15-structure ensemble of the CTD.

Figure S4. A secondary structure diagram of the pRNA mimic. The secondary structure was predicted using the mFold web server (1).

Figure S5. Superimpostions of CTD with RNase H family bound to nucleic acid substrate. (A) The superimposition of CTD with *T. thermophiles* RuvC bound to a Holiday Junction (2)(PDB: 4LD0). The front helices of the RuvC are partially transparent to better visualize the beta-sheet. **(B)** The superimposition of CTD to RNase H1 bound to an RNA/DNA hybrid (3)(PDB: 2QKK). **(C)** The same superimposition as (B) with the RNase H1 removed. The residues are colored by their CSP with dsDNA bound (Fig. 5C): >1 std. dev. (yellow), >2 std. dev. (orange), >3 std. dev. (red).

Figure S6. High-resolution structures of phi29 motor components fit to cryoEM density. (A) A side-view of the CTD fitted in its corresponding model. (B) The same view as (A) where the density has been removed to facilitate viewing. (C) A view from the bottom of the CTD towards the procapsid with the density removed. The view is the same as Fig 5H. (D) A view from the top of the CTD towards the NTD.
(E) The same view as (D) with the density removed. The NMR structure of the CTD is shown in cyan with

DNA-interacting residues identified in CSP data colored as in Fig S5. The crystal structures of the NTD (4)(PDB: 5HD9) is shown in medium blue and the connector protein (5)(PDB: 1FOU) is shown in khaki. The models of the pRNA (6)(PDB: 3R3F) and of B-form DNA are shown in magenta and red respectively, with bases colored blue.
