

Supplemental Figure 2: Forest plot of clinical studies on pharmacological conditioning in patients with acute myocardial infarction and with biomarker release or imaging techniques to estimate infarct size as end-point. The zero represents the mean value, and the gray bars represent the standard error of the mean for the placebo group. Closed squares represent significantly reduced infarct size ($\bar{x} \pm \text{SEM}$), open squares represent non-significant changes.

The star on the midline is used when no information was given to the standard error of the mean. ANP = atrial natriuretic peptide; CK(-MB) = creatine kinase (muscle-brain); drug = pharmacological conditioning group; Fx06 = peptide derived from the neo-N-terminus of fibrin; G-CSF = granulocyte-colony stimulating factor; GIK = glucose-insulin-potassium; (hs)Tn(I/T) = (high sensitive) troponin (I/T); IGF1 = insulin-like growth factor 1; LeukArrest = rovelizumab; n.s. = not significant; MRI = magnetic resonance imaging; MTP-131 = cardiolipin-targeting peptide; PLA = placebo group; SNP = sodium nitroprusside; SPECT = single-photon emission computed tomography; TRO40303 = 3,5-seco-4-nor-cholestan-5-one oxime-3-ol; * = dual anti platelet therapy
