

Supplementary Figure S1. (a) Polytene chromosomes of *R. americana* after *in situ* hybridization (red signal) using the probe made of DNA from the microdissected X-1 chromosome end of *T. pubescens*. (b) The same chromosomes stained with DAPI and (c) the corresponding merged signals. Bar = 15 μ m.

Supplementary Figure S2. Results of insert sequencing from the plasmid library made with DNA from the microdissected X-1 chromosome end of *T. pubescens*.

Supplementary Figure S3. Localization of phage 2 probe from the screening of the genomic library of *T. pubescens* in chromosomes of *R. americana*. Hybridization detection was made with alkaline

phosphatase and the chromosomes photographed under bright field. Heterochromatic ends identified in the figure correspond to the regions containing more intense hybridization signals.

Supplementary Figure S4. Localization of pTp-1 probe in *T. pubescens* chromosomes. (a) hybridization signals, (b) chromosomes stained with DAPI and (c) the merged hybridization and DAPI signals. Bar = 15 μ m.
