

Supplementary Fig 1 | CD4⁺ T cell phenotypes during the priming phase of EAE.

a, Percentages and activation status of CD4⁺Foxp3⁺ T cells in dLN. **b**, and **c**, Cytokine production by CD4⁺Foxp3⁺ in dLN at various time points post immunization (N \geq 3, mean \pm SE). **d**, Percentages of and IL-10 production by of CD4⁺Foxp3⁺ cells in dLN at various timepoints post immunization (N \geq 3, mean \pm SE). **e**, Ly-6C expression by CD4⁺Foxp3⁺ T cells in dLN and **f**, spleen three days post EAE immunization (N \geq 7, mean \pm SE, *p < 0.05). **g**, 2D2 cells (1X10⁶) were transferred to WT or cKO mice at d -1. Mice were immunized with MOG-CFA on d 0 and injected with pertussis toxin on d 0 and 2. dLN were analysed on d4 for percentages of 2D2 cells **h**, IFN- γ and IL-17A producing 2D2 cells **i**, IFN- γ and IL-17A production by recipient CD4⁺ T cells. (N=4, mean \pm SE, representative of two independent experiments). **j-k**, FACS purified CD4⁺Foxp3⁺ cells from dLN three days post EAE induction were transferred into naïve CD45.1 mice. Percentage of CD45.2⁺ cells and CD45.2⁺Foxp3⁺ cells in the spleen of recipient mice were determined 18 d. Data are representative of two independent experiments each with at least 3 mice per group.

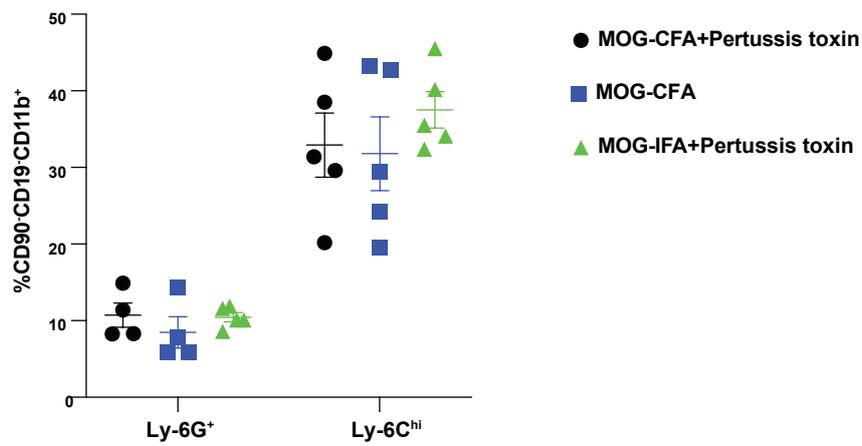

Supplementary Fig. 2 | Phenotypic and molecular characterization of cKO Tregs.

a, Cell surface antigen expression on CD4⁺Foxp3⁺ cells from spleen of unimmunized Fxp3^{YFP-Cre} (black) or IFNAR^{fl/fl}Fxp3^{YFP-Cre} mice (red).

Data are representative of mean ± SE, N ≥ 4, *p < 0.05.

b, Volcano plots of RNA-seq analysis of Fxp3^{YFP-Cre} or IFNAR^{fl/fl}Fxp3^{YFP-Cre} mice LN from unimmunized mice. N=3 mice.

Supplementary Fig. 3 | Homing of MDSCs to dLN does not require Pertussis toxin or CFA.

Mice were divided into 3 groups.

One group was immunized with MOG-IFA s.c on d 0 and received Pertussis toxin i.p d 0 and d 2; the second group received only MOG-CFA s.c on day 0 .

The control group received MOG-CFA s.c d 0 and pertussis toxin i.p on d 0 and 2.

dLN were analyzed for CD11b⁺ cells at day 5. N=4, mean± SE.
