

**Figure S2.** Bland-Altman plots demonstrating relative validity of the FFQ versus 24-h recalls for non-fermented foods. Group-level relative validity shown for: **(a)** non-fermented dairy, **(b)** butter, **(c)** cream, **(d)** ice cream, **(e)** milk, **(f)** non-fermented soya. The middle line indicates the mean difference, while the upper and lower lines indicate the 95% confidence intervals, respectively [calculated as: mean  $\pm$  (standard deviation of the mean difference X 1.96)].
