

S3 Fig. Neighbour-joining tree of 84 ramets representing 30 different clones (2-3 ramets per clone) provided by the Allerweltsgrün nursery (Köln).

It is based on 12 nSSR markers with the final ranking combination obtained according to Pfeiffer et al. [42] and the 'bruvo genetic distance' [45].

Numbers indicate bootstrap values (not percentage). The sample ID represents the clone ID followed by the ramet consecutive number.
