

Supplementary Figure S1

Supplementary Figure S1 Significantly changed canonical pathways of the DEGs between ZDF and ZCL rats using IPA

The left color key represents the activation z-score ranging from low (green) to high (red) (z-score > 0, activation; z-score < 0, inhibition). The right color key indicates the significance ranging from low (yellow) to high (orange) ($-\log(p\text{-value}) > 1.3$). The values of z-scores and $-\log_{10}(p\text{-value})$ are shown in the cells.
