

Figure S3. Combined cell-therapy with MDSCs and Treg altered the subpopulation of T cell in peripheral blood.

Twenty-eight days after BMT, peripheral blood from each group of mice were isolated and the expression levels of IL-4, IL-17, IFN- γ , and Foxp3 were determined by flow cytometry. This experiment was performed once using 6 mice.* $p < 0.05$, ** $p < 0.01$). Numbers in the plots indicate percentages of gated cells.
