

**Figure S7. Competition of *dnaA* mutants during treatment with partially inhibitory concentrations of ethionamide (ETH) and ethambutol (EMB).** INH is included as a positive control. (A) Final OD<sub>600</sub> of the bulk culture after 6 days of growth. Each dot represents an independent culture with the mean and standard deviation shown. (B-F) Relative abundance of each strain normalized to input library. Dots represent mean normalized abundance and bars show the standard deviation of three replicates.
