Ctrl (control), Fe (inorganic Fe addition, $FeCl_3$), DFB (iron complexed to desferrioxamine B), GLU (Fe complexed to glucuronic acid), CAR (Fe complexed to carrageenan), L_6 (Fe complexed to bacterial exopolymeric substance (EPS)), L_6vd (Fe complexed to virally degraded EPS), L_{22} (bacterial EPS) and EPS (in situ EPS isolated form Bio 1).

Supplemental Table 2. Evaluation of scaled PLP concentrations using linear mixed models fit by REML. To capture all pairwise station relationships, two models were created with all stations combined: one model with Bio 1 as the reference and a second with Bio 2 as the reference. The reference treatment was the experimental control, treatment and stations were assigned as fixed effects, and analysis group was assigned as random effect. P-values were calculated using the lmer function of the lmerTest package in R. Standard error is the standard error for the modeled intercept. Significance levels are denoted by ($p < 0.1$), * ($p < 0.05$), ** ($p < 0.01$), *** ($p < 0.001$). Model variances are reported in Supplemental Table 10.

Reference Station	Fixed Effect	Estimate	Std. Error	df	t value	Pr(>|t|)

Supplemental Table 3. Evaluation of scaled PLP concentrations using linear mixed models fit by REML. One model was created for each station. In all cases, the treatment reference (assigned fixed effect) was the corresponding experimental control and analysis group was assigned as random effect. P-values were calculated using the lmer function of the lmerTest package in R. Estimate is estimated intercept for the reference variable (here, the controls). Standard error is the standard error for the modeled intercept. Significance levels are denoted by ($p < 0.1$), * ($p < 0.05$), ** ($p < 0.01$), *** ($p < 0.001$). Model variances are reported in Supplemental Table 10.

13

Supplemental Table 12. Pearson product moment correlation amongst parameters measured. Data were obtained from Supp. Table 10 using Sigma Plot (version 14.0). The top number is the coefficient of correlation, the middle number is the p value and the bottom number is the number of observations. For significant correlations (at level of 95%), p values are shown in red.
