Supplementary Figure S3. Plot of the predicted class probabilities for samples from UIP(+)RA, NSIP(+)RA, and CLD(-)RA using the PLS-DA model created with the three metabolites. The cutoff value was 0.5 due to balanced subsampling. UIP(+)RA: rheumatoid arthritis patients with usual interstitial pneumonia, NSIP(+)RA: rheumatoid arthritis patients with non-specific interstitial pneumonia, CLD(-)RA: rheumatoid arthritis patients without chronic lung diseases, PLS-DA: partial least squares-discriminant analysis.
