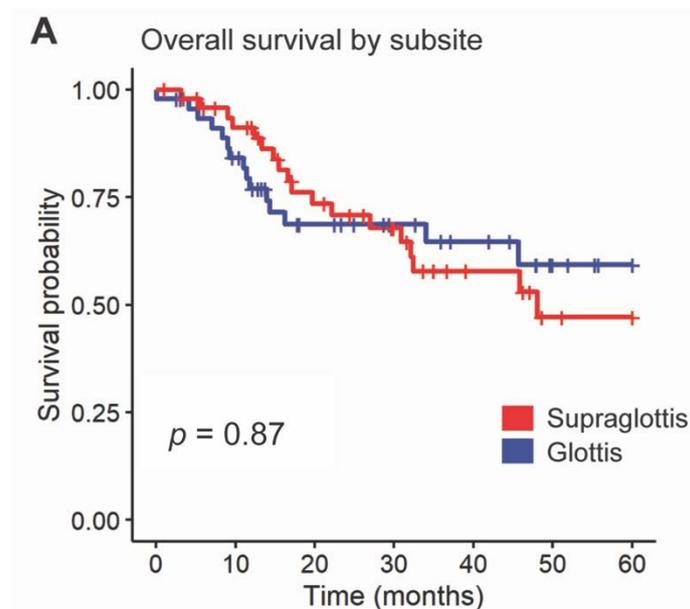

Figure S1. Kaplan-Meier curves for overall survival between supraglottic and glottic LSCC. A log-rank test was used to compare the Kaplan-Meier curves between tumors of the glottis and supraglottis.

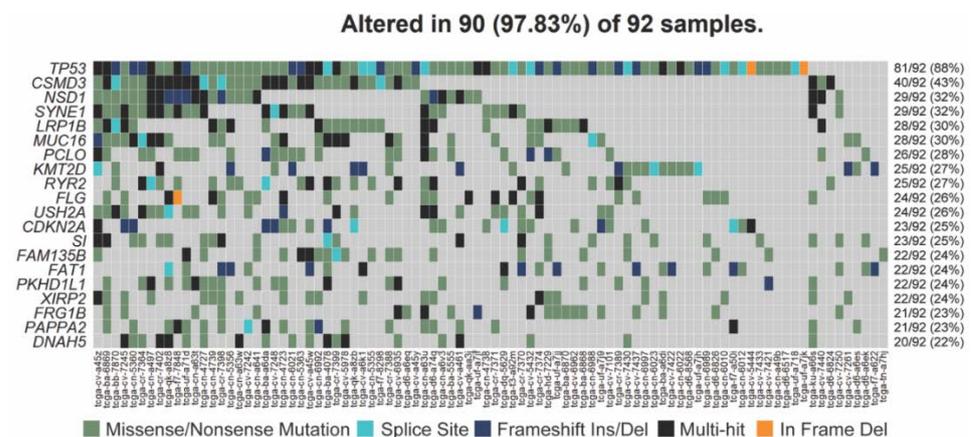

Figure S2. Top 20 genes by SNV frequency in the combined TCGA LSCC cohort. TCGA sample IDs, absolute number and frequency for each mutation are included.

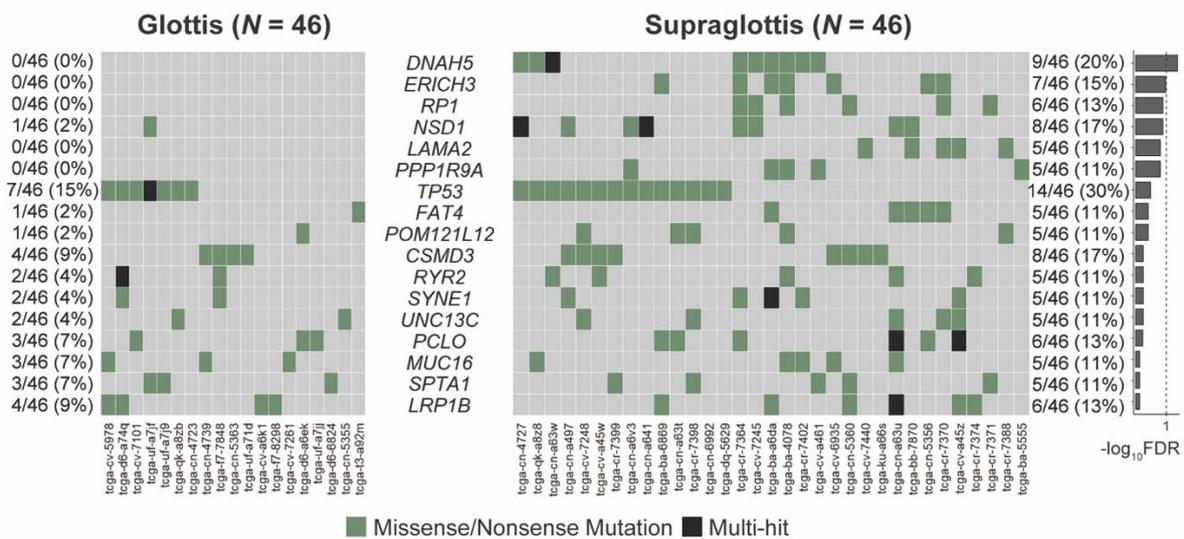

Figure S3. Genes with differing SNV mutation frequencies between supraglottic and glottic LSCC by G > T mutation load. FDR = false discovery rate.

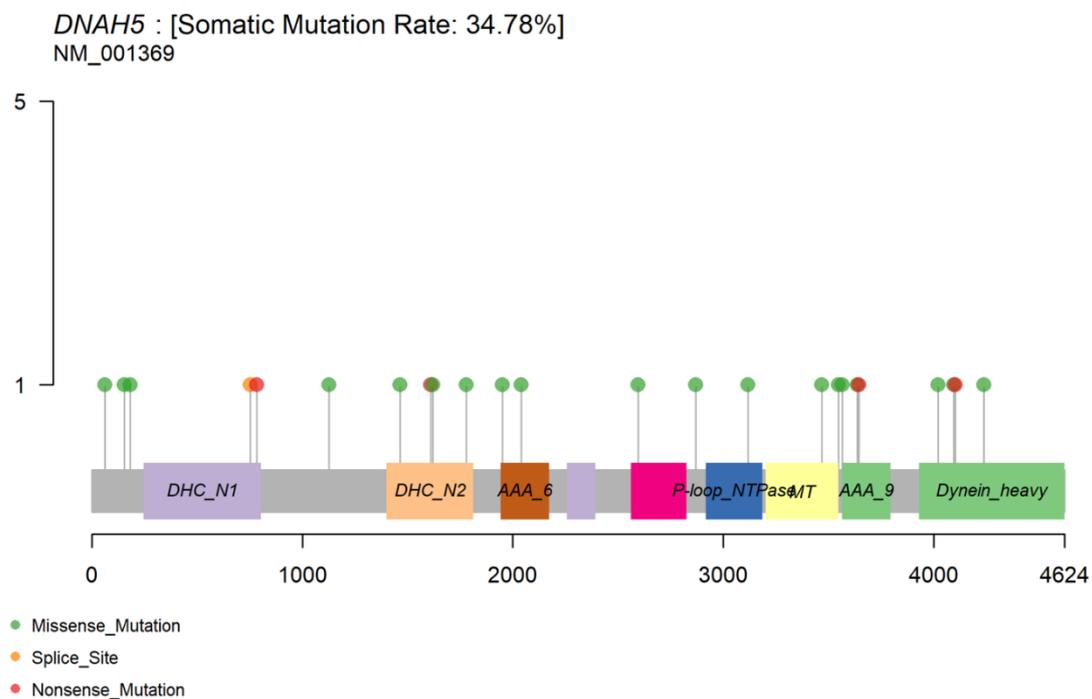

Figure S4. Lollipop plot of SNVs in *DNAH5*.

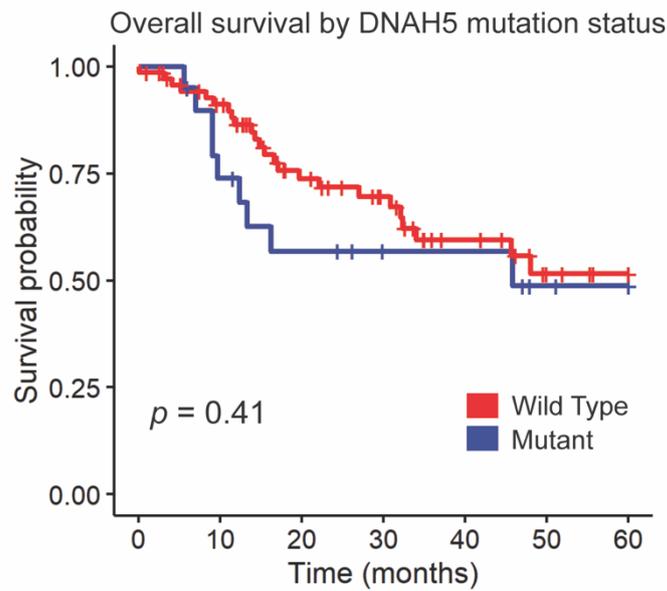

Figure S5. Kaplan-Meier curves for overall survival by *DNAM5* SNV mutation status. A log-rank test was used to compare the Kaplan-Meier curves between tumors with wild-type and mutant alleles.

Volcano plot

EnhancedVolcano

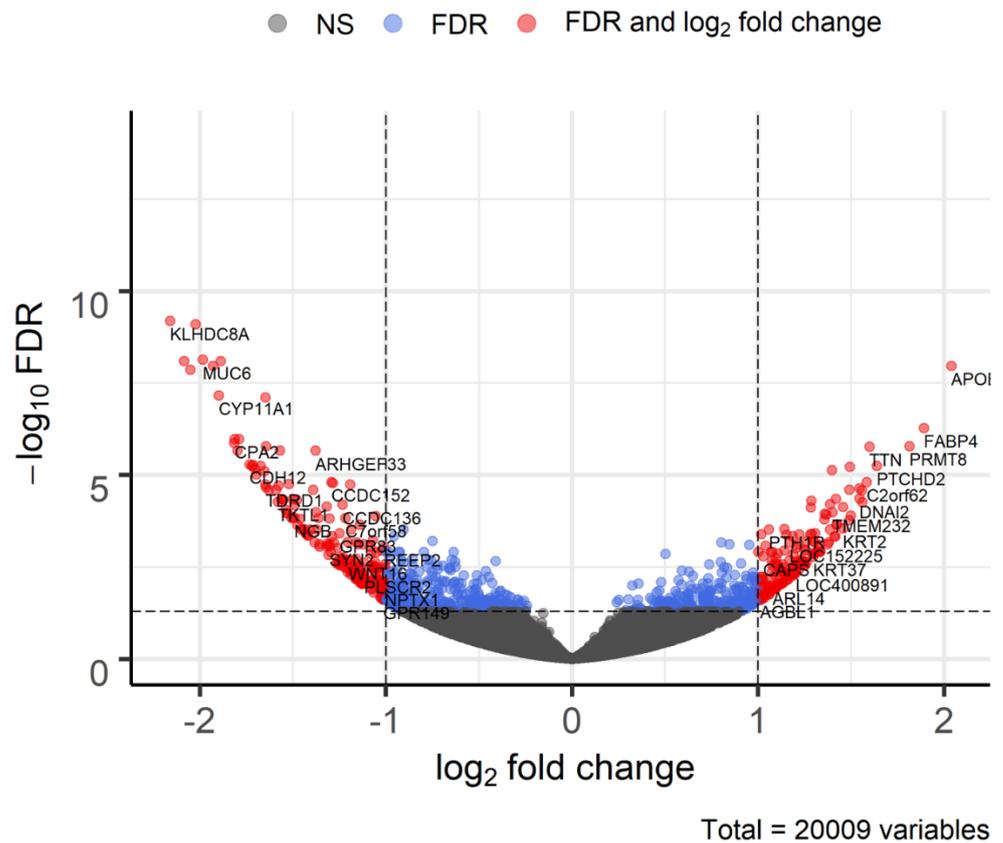

Figure S6. Volcano plot for mRNA abundance between glottic and supraglottic LSCC. 282 genes were found to have significant FDR-corrected significance values and greater than two-fold

change in transcript levels between glottic and supraglottic tumors. Genes with positive log₂ fold change are more abundant in glottis, and vice versa.

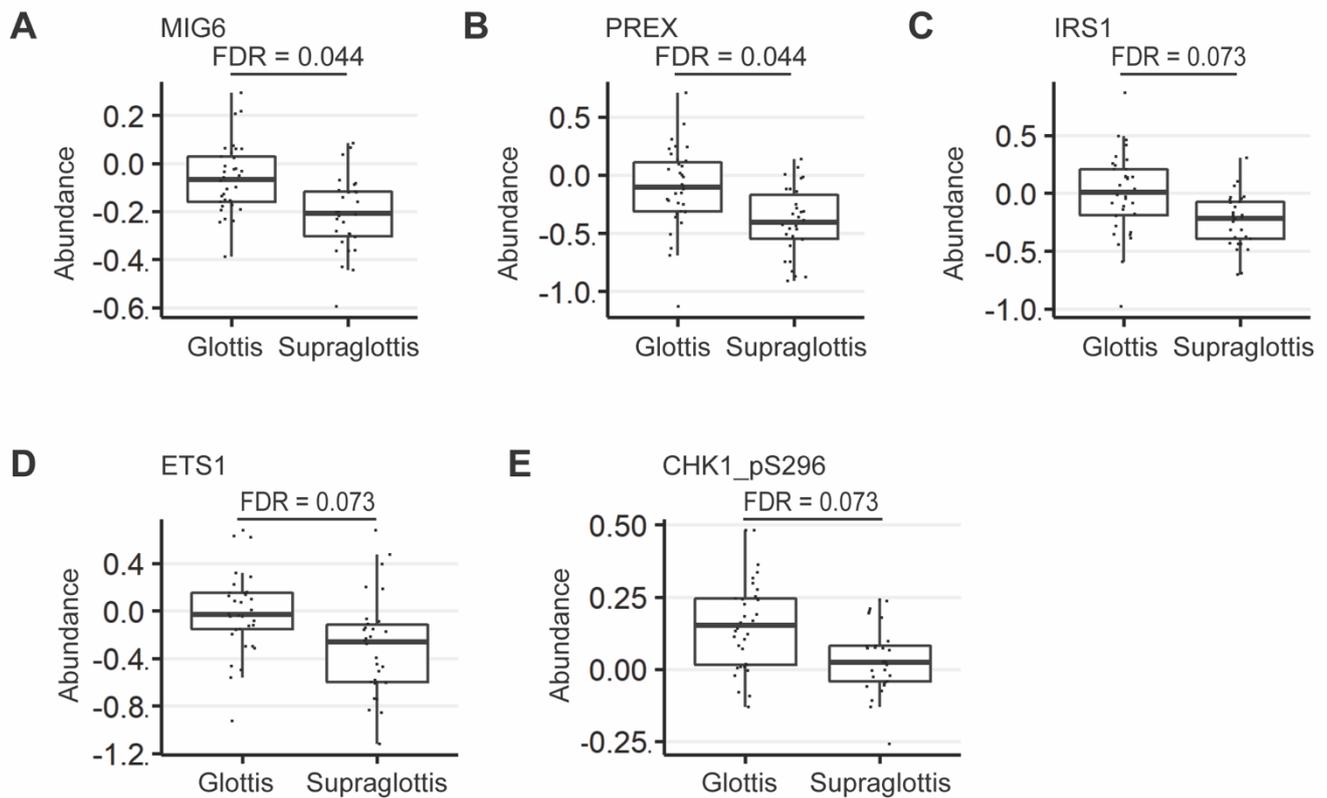

Figure S7. Differentially abundant proteins between supraglottic and glottic LSCC. Mann-Whitney U test was used to compare median protein abundance levels, and FDR correction was done using Benjamini-Hochberg method.

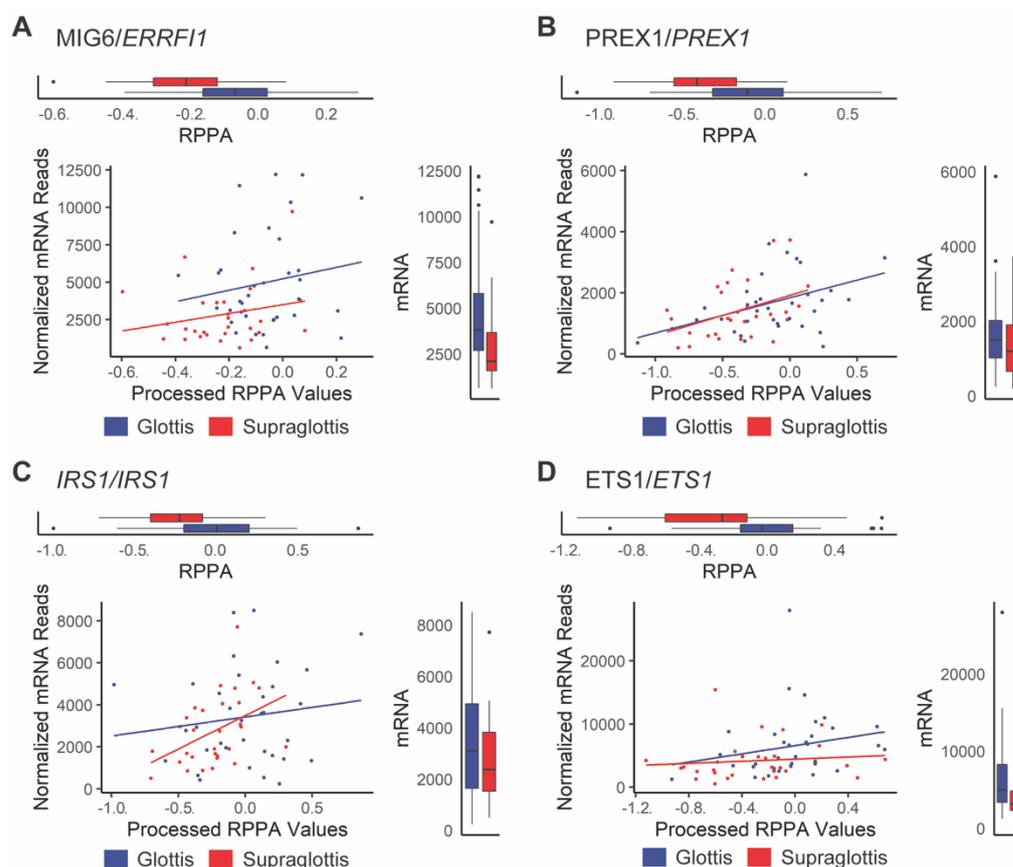

Figure S8. Four most differentially abundant proteins between supraglottic and glottic LSCC correlated with mRNA levels. Significance determined by FDR < 0.1 and positive Spearman's correlation. (A) ERRFI1 ($\rho = 0.27$, FDR = 0.046), (B) PREX1 ($\rho = 0.41$, FDR = 0.0028), (C) IRS1 ($\rho = 0.26$, FDR = 0.046), (D) ETS1 ($\rho = 0.40$, FDR = 0.0028).

Table S1. Multivariate analysis of overall survival. Backward selection was used to attain the multivariate model. No multivariate model could be created in this way for progression-free survival.

Table S3. Pathway over-representations from genes with differential frequencies of SNVs and CNAs correlated with mRNAs between glottic and supraglottic LSCC. Blue indicates genes with higher mRNA abundance and copy number in the supraglottis, whereas red indicates genes with higher mRNA abundance and copy number in the glottis. The uncolored genes represent those with differences in SNV.
