

Supplemental figure 1. Infiltrate type and laterality of ICI-pneumonitis upon diagnostic computed tomography scan. Infiltrate types were classified as having consolidation, ground-glass opacities (GGOs), crazy-paving pattern, traction bronchiectasis, or nodularity and were either unilateral or bilateral. The infiltrate types reported are depicted in the Venn diagram with further treatment group-specific details depicted in the associated table. One case only depicted features of nodularity as is shown as an adjunct to the Venn diagram.

Abbreviations: ICI – immune-checkpoint inhibitor; GGOs – ground glass opacities; IVIG – intravenous immunoglobulin

Supplemental table 1. Baseline characteristics, steroid-refractory ICI-pneumonitis cases, treatments, and outcomes by individual patients in the case series.

Therapy type	IVIG only							Infliximab only		Combination
Patient number	1	2	3	4	5	6	7	8	9	10
Patient characteristics										
Age at ICI-P diagnosis, years	61	85	35	76	64	73	71	68	64	79
Sex	F	M	M	F	F	M	M	F	F	M
Race	W	W	B	W	W	W	W	W	W	W
Smoking status, pack years	Former, 17/5	Never	Never	Former, 50	Never	Former, 25	Former, 25	Former, 60	Former, 15	Former 37.5 Oropharyngeal
Primary tumor site	NSCLC	Pancreatic	SCLC	NSCLC	NSCLC	NSCLC	RCC	NSCLC	NSCLC	SCC
Tumor histology	Adeno	Adeno	N/A	Adeno	Adeno	Adeno	Papillary	Adeno	Adeno	SCC
Initial cancer stage (I-IV)	IIIA	III	III	II	IV	IV	IV	II	IV	IV
