Statistical Tables

Tables S1, S2, and S3 below show the results from statistical testing. All statistical tests used were two sample t-tests assuming equal variances. All three tables display the results of a one-tailed test, which tests whether the second group has a mean statistically higher than that of the first group ($H_0: \mu_2 \leq \mu_1$). The null hypothesis is considered rejected when $p < 0.05$ ($\alpha = 0.95$) and the t-statistic is negative.

TABLE S1. Results from statistical testing between different cellular regions for each treatment.

¹ the trend is not statistically significant

² the trend is significant in the opposite direction ($\mu_2 \leq \mu_1$).

TABLE S2. Results from statistical testing between different experimental time points for each cellular region.

Histology Images

All histology images were obtained using an Axio Imager M2 upright microscope (Zeiss, Germany), and a 100x ACHROPLAN water-immersion objective (Zeiss, Germany). Samples were immersed in ddH₂O for analysis.
