

Supplemental Materials

Supplemental Methods

Animals: Three- to four-months old male and female C57BL/6 (C57) mice were used in this study. The facility monitors and maintains temperature, humidity, and a 12 h light/dark cycle. A maximum of 5 mice were housed in a cage with an individual ventilating system and irradiated bedding (1/8-inch Bed O's Cobs, The Anderson, Maumee, OH). Sterilized food (PicoLab Rodent diet 5053, LabDiet, St. Louis, MO) and water were freely accessible in their cages. Experiments were initiated in 3-4-month-old male/female C57BL/6 mice (Jackson Laboratories, Bar Harbor, ME).

Transient middle cerebral artery occlusion (MCAO): According to our published studies^{1,2}, mice were anesthetized with a mixture of isoflurane/oxygen/nitrogen and a 6-0 Teflon-coated black monofilament surgical suture (Doccol, Redland, CA) was inserted into the exposed external carotid artery, advanced into the internal carotid artery, and wedged into the Circle of Willis to obstruct the origin of MCA. The filament was left in place during a 30 min ischemic period and then withdrawn. Cerebral blood flow (CBF) was measured prior to stroke, during the occlusion period, and 10 min after reperfusion by Laser-Doppler flowmetry (Periflux System 5010; Perimed, Järfälla, Sweden). Animals exhibiting greater than 80% reduction of pre-ischemic baseline CBF during MCAO and CBF greater than 80% of baseline blood flow by 10 min of reperfusion were included in the study. Body temperature was maintained at $37 \pm 0.5^{\circ}\text{C}$ during the entire surgical procedure via a rectal probe connected to a thermocoupler-regulated heating water coil in the surgical board. Mice were then placed in a recovery cage, where their body temperatures were maintained at $37 \pm 0.5^{\circ}\text{C}$ until they regained consciousness and resumed activity. The mice were then returned to their home cages with their cage mates. Warm saline was administered subcutaneously to prevent dehydration during the acute phase. Softened food and hydrogel (Clear H₂O) were given during the first week of recovery. Mice typically started to regain body weight around days 3-5 and continued to recover from stroke.

Tissue collection and total RNA extraction: Mice were randomly assigned to 10 different post-stroke survival times (pre-stroke [naïve], acute [1h, 3h, 6h, 1d, 3d], subacute [1w, 2w], recovery [1m, 2m, 6m]), and their brains were collected and stored at -80°C for RNA extraction. The brain block containing the entire infarct region (+3.1mm to -4.1mm from bregma) was cryosectioned, cut in half and collected for contralateral and ipsilateral hemispheres according to a method described previously¹. Total RNA was extracted using Tri reagent (MRC, OH). After homogenization of brain tissue in 1 ml of Tri reagent, 240 µl of chloroform was added, mixed, homogenized, and then centrifuged at 10,000 rpm for 10 min at 4°C. The upper layer was transferred into a clean tube and 2 volumes of 100% cold ethanol was added. The mixture was kept in -20°C for at least 1 h to precipitate RNA and centrifuged at 10,000 rpm for 10 min at 4°C. The precipitate was dried for 10 min at room temperature and then resolved in diethyl pyrocarbonate-treated water. The RNA concentration and purity were determined by measuring the absorbance at 260nm and 280nm. The RNA was stored at -80°C until RNA seq analysis.

RNA-seq data generation: Strand-specific RNA-seq libraries were prepared from 500 ng RNA using KAPA stranded mRNA-Seq Kit (KAPA Biosystems). The libraries were amplified by twelve-cycle PCR. Sequencing was performed on Illumina HiSeq®2000 (Illumina) by multiplexed single-read run with 33 cycles. The resulting FASTQ files were analyzed via FastQC to ensure sufficient data quality. The reads were mapped to the mouse genome (mm10) using commercial

software ArrayStudio (OmicSoft) with two mismatches allowed. In our samples, 83%-90% of the reads were uniquely mapped.

Differential gene expression analysis: Gene expressions were derived from raw sequencing reads using the OmicSoft ArrayStudio RNASeq analysis pipeline (Qiagen Inc). For each gene, reads uniquely mapped to the exons were identified and counted. The resulting read counts were summarized at the gene level as raw expression. Genes were flagged as “absent” or “present” in each sample using an empirical minimum raw read count of 10. For a comparison between two groups of samples, we excluded genes that were not flagged as “present” in at least 75% of the samples of the higher expressing group. For differential gene expression analyses using the DESeq2 package³, the raw read counts across samples were first normalized to adjust for the variation in sequencing depth. The dispersion of the expression was estimated by sharing information across genes with similar expression levels. Tests for differential expression were based on an expression model employing the negative binomial distribution. Independent group comparisons were used to identify differentially expressed genes for the post- versus pre-treatment groups, while paired comparisons were used to identify differentially expressed genes for ipsilateral versus contralateral hemispheres for every animal within each time point. The statistical significance level (p-value) of the differential expressions were assessed using the Wald test. The fold change was computed as the effect size of the treatment, reflecting the difference in the expression between the two groups. Significantly differentially expressed genes were identified using the criteria of i) fold changes greater than 1.5 and ii) p-values less than 0.05.

Gene expression profiles: The profiles were derived from raw sequencing reads using OmicSoft ArrayStudio RNASeq analysis pipeline (Qiagen Inc). Read counts were normalized using DESeq2.0 package. Differential gene expressions were identified using DESeq2 package³ with a cutoff threshold ≥ 1.5 change and p value at 0.05.

Heat map: For each gene in each sample, the normalized read count was further normalized against the mean of all control samples followed by a log (base 2) transformation. Genes were organized by a hierarchical clustering algorithm using Euclidean distance (L2 norm) and an average linkage algorithm using Partek software (<https://www.partek.com/>). Gene expressions were derived from raw sequencing reads using OmicSoft ArrayStudio RNASeq analysis pipeline .

Clustering analysis: For each gene, DESeq2.0 normalized read counts of each sample were further normalized against the mean of the control samples (without the MCAO procedure). The normalized values in each biological replicate group were then averaged for each gene to produce a matrix of size $m * n$, with m being the number of significantly perturbed genes in either the ipsilateral or contralateral brain, and n being the 11 time points, including the pre-MCAO (or baseline/naive) group. The values of each gene across all time points were further normalized to a standard deviation of 1 and each value was then subtracted by the value of the control samples. The Davies-Bouldin method⁴ was used to estimate the number of K clusters. The K-means method, based on Pearson dissimilarity, was used to cluster the genes using Partek software (St. Louis, Missouri)⁵.

Pathway analysis: Significant genes identified from each time point were subjected to canonical pathway analysis using Ingenuity Pathway Analysis software (Qiagen, Redwood, California). Gene clusters identified from clustering analysis were subjected to Pathway Enrichment Analysis using NextBio (Illumina, Cupertino, California). In the NextBio Pathway Enrichment Analysis, genes were ranked by the Pearson correlation of the expression pattern of

each gene in the cluster with the average pattern of the cluster. The results obtained by NextBio were further organized into MSigDB Reactome categories⁶.

Isolation of brain immune cells: Mice were anesthetized with isoflurane and pentobarbital and then perfused with ice-cold, heparinized phosphate-buffered saline (PBS) to remove blood. Brains were removed and the hemispheres were separated and placed into ice-cold Hanks' balanced salt solution (HBSS, Life Technologies, Grand Island, NY) without Ca²⁺ and Mg²⁺. The tissue was enzymatically and mechanically dissociated with MACS Neural Tissue Dissociation Kits with Papain (Miltenyi Biotec, Bergische Gladbach, Germany). The dissociated tissue was used to obtain brain homogenates or isolated brain immune cells. Brain immune cells were isolated according to a previously described method⁷. Cells were centrifuged by discontinuous Percoll PLUS (GE Healthcare, Sweden) gradients and collected from the 37-70% interphases.

Flow cytometry analysis: Single cells (0.5-1×10⁵) were pre-incubated with mouse BD Fc Block (anti-CD16/CD32, ≤ 1 µg/10⁶ cells in 100 µl, BD Biosciences), then incubated with 10% FBS in PBS at 4°C for 15 minutes, and stained with antibodies against CD11b (PE-Cy7 rat anti-mouse CD11b, 1:400, 552850) and CD45 (PE rat anti-mouse CD45, 1:1000, 553081) in 1% FBS in PBS at 4 °C for 1 h. After washing with PBS, cells were immediately analyzed (Miltenyi Biotec, San Diego, CA). Unstained cells and stained cells with the corresponding isotype controls (PE-Cy7 rat IgG2b, κ isotype control, 552849; PE rat IgG2b) were used for negative controls. Antibodies and isotype controls used for flow cytometry were purchased from BD Bioscience or Miltenyi Biotec.

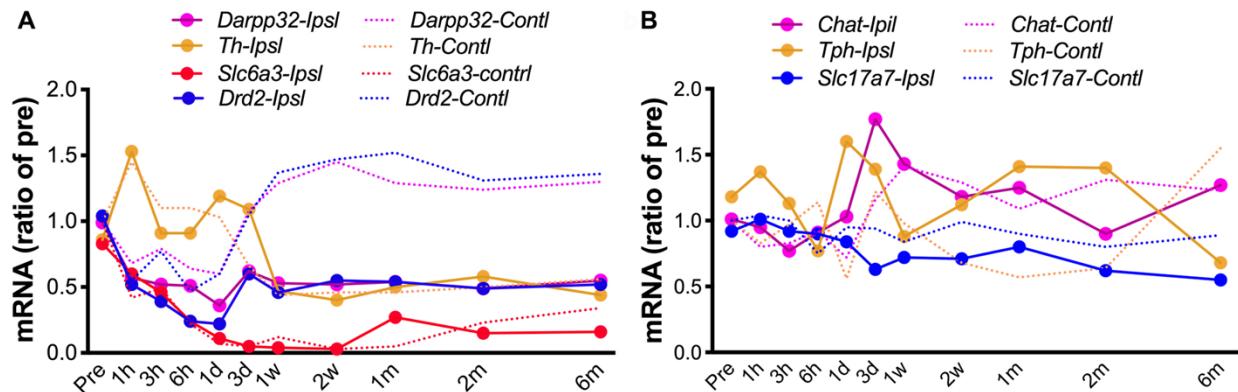

Immunostaining of brain tissue: The mice were perfused transcardially with 4% paraformaldehyde in 0.1 mol/L phosphate buffer. Brains were collected, post-fixed overnight, transferred into a 30% sucrose solution, and sectioned in a cryostat at a 30-µm thickness for the immunohistochemistry. Brain sections were washed in PBS solution at pH 7.4, and incubated with 1% bovine serum albumin and 5% normal goat serum for 1 hour at room temperature. The sections were then incubated with anti-rabbit Iba-1 (1:1000, Wako, Richmond, VA, 019-19741) and anti-chicken GFP (1:1,000, Aves Lab, Davis, CA, AB16901) overnight at 4°C. Sections were washed with PBS and then incubated with secondary antibodies conjugated with Alexa Fluor 488 goat anti-chicken IgG (1:2000, Life Technologies, A11039) or Alexa Fluor 594 goat anti-rabbit IgG (1:2000, Life Technologies, A11012) for 1 hour. After washing with PBS, the sections were mounted using Fluoroshield reagent with DAPI (Sigma-Aldrich, F6057) and examined under a laser scanning confocal microscope (Carl Zeiss, Thornwood, NY, USA).

Adoptive Transfer of Splenocytes: According to our previously published method⁸, 13-week-old mice were anesthetized with isoflurane and an ~1 cm incision was made on the left side of the abdominal cavity under the rib cage. The spleen was removed by cutting the mesentery and connective tissue, and the splenic vessels were cauterized. As an analgesic, meloxicam (5 mg/kg, P.O.) was administered just prior to surgery, in addition to buprenorphine (0.5 mg/kg, S.C., every 12 h for first 48 h after surgery) and bupivacaine (0.1 ml of 0.25-0.5%, S.C., on incision site before incision). For the preparation of splenocytes, a spleen from GFP (green fluorescent protein positive) transgenic mice (Jackson lab C57BL/6-Tg(CAG-EGFP)1Osb/J) was excised and minced using scissors, then pipetted in ice-cold Hanks' balanced salt solution (Life Technologies) without Ca²⁺ and Mg²⁺. The mixture passed through a 70 µm strainer and then centrifuged at 3,000 rpm for 10 minutes at 4°C to isolate splenocytes. Cells were centrifuged by discontinuous Percoll PLUS (GE Healthcare) gradients and collected from the 37–70% interphases. The mononuclear cells (1x10⁷) were adoptively transferred into asplenic MCAO mice via the retroorbital venous sinus 1 day before sacrifice (2day after stroke for 3d survival and 59th day after stroke for 2m survival). Twenty-four hours after the cell transfer, the mice were sacrificed.

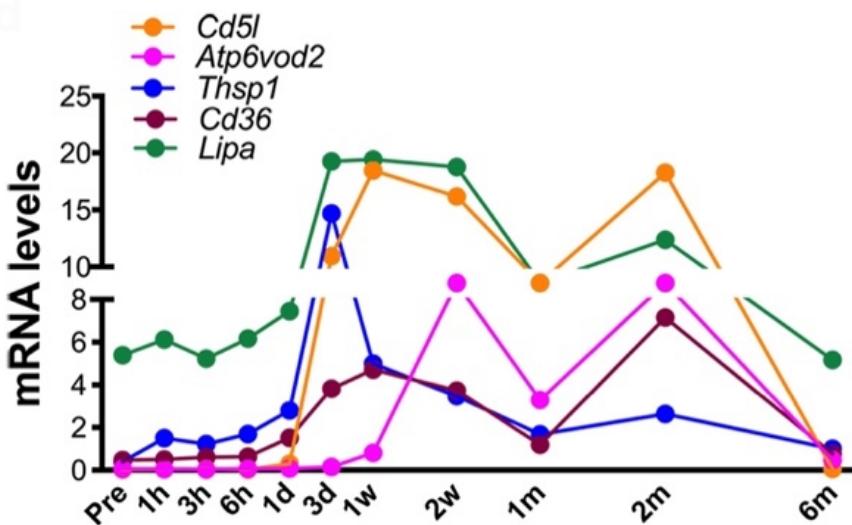

Whole brain imaging: Fixed adult mouse brains from GFP⁺ MM cell injected animals were delipidated with a modified Adipo-Clear protocol⁹. Perfusion fixed brain samples were washed with B1n buffer (H₂O/0.1% Triton X-100/0.3 M glycine, pH 7), then transferred to a methanol gradient series (20%, 40%, 60%, 80%) in B1n buffer, 4 mL for each brain, 1 h for each step; then 100% methanol for 1 h; then overnight incubation in 2:1 mixture of DCM:methanol and a 1.5 h incubation in 100% DCM the following day; then 100% methanol for 1 h three times, and reverse methanol gradient series (80%, 60%, 40%, 20%) in B1n buffer, 30 min for each step. Samples were then washed in B1n buffer for 1 h and overnight. The above procedures were done at room temperature with rocking to complete delipidation. The delipidated samples were then blocked in PTxwH buffer (PBS/0.1% Triton X-100/0.05% Tween 20/2 µg/ml heparin) with 5% DMSO and 0.3M glycine for 3 h and overnight at 37°C, then washed with PTxwH for 1 h, 2 h, and overnight at room temperature. For staining, brain samples were incubated in primary antibody (Aves 1020; chicken anti-GFP, 1:5000) diluted in PTxwH for 14 days at 37°C. After primary antibody incubation, samples were washed in PTxwH for 1 h, 2 h, 4 h, overnight, then 1 d three times, and then incubated in secondary antibody (Jackson ImmunoResearch 703-606-155, Alexa Fluor 647 donkey-anti-chicken, 1:1000) diluted in PTxwH for 10 days. Samples were then washed in PTxwH for 1 h, 2 h, 4 h, overnight, then 1 d three times. Samples were finally washed in PBS for one day, then proceeded for clearing with iDISCO⁺¹⁰. Samples were dehydrated with methanol gradient with water, then 100% methanol, DCM/methanol mixture overnight, and 100% DCM for 1h twice the next day. Brains were finally cleared for 4 h in dibenzyl ether and then stored in a fresh tube of dibenzyl ether before imaging with a LaVision Ultramicroscope II lightsheet fluorescent microscope using 4x objective. Volume imaging datasets were processed using Imaris x64 software (version 8.0.1, Bitplane) to generate the whole brain perspective views and coronal fly-through scanning movies.

Data Availability: A complete list of 24,475 genes analyzed and described in this study (Figure 1) was deposited and available in NCBI Short Read Archive (SRS), accession number: PRJNA525413. Lists of genes for cluster analyses and immunity described in Figures 4,5 are available in supplementary table I. Other relevant data are presented within the article.

Supplemental Figures

Supplemental Figure I. Neuronal marker gene expression across stroke stages. **A**, Markers for neurons in the striatum and substantia nigra. Ppp1rla (Darpp32, striatal neurons) and Drd2 (dopamine receptor D2) are among the significantly perturbed genes in cluster 2. Th (tyrosine hydroxylase) and Slc6a3 (dopamine transporter) were downregulated in the ipsilateral hemisphere. **B**, Gene expression for cholinergic (*Chat*, choline acetyltransferase), serotonergic (*Tph1*) and glutaminergic (*Slc17a7*, vesicular glutamate transporter 1) markers. mRNA levels were expressed as ratios of pre-baseline values.

Supplemental Figure II. Expression profiles of selected M2 genes that showed biphasic gene profiles over time.

Video I. Video of cleared whole-brain imaging at 3 days post-stroke (related to Figure 6C). The movie shows the infiltrated GFP+ cells from cleared whole brain in 3 days after stroke. Two days after splenectomy, mice received GFP+ splenocytes and were sacrificed 24h after splenocyte infusions. GFP+ cells are infiltrated splenocytes.

Video II. Video of cleared whole-brain imaging at 2 month post-stroke (related to Figure 6C). The movie shows the infiltrated GFP+ cells from cleared whole brain in 2 month after stroke. Two days after splenectomy, mice received GFP+ splenocytes and were sacrificed 24h after splenocyte infusions. GFP+ cells are infiltrated splenocytes.

Supplementary Table I. A complete gene list by each cluster in the contralateral and ipsilateral hemisphere and the expression of innate immune, adaptive immune, M1, and M2, genes across time points in the ipsilateral stroked brain hemisphere. M1, M2, Adaptive and Innate immune gene lists were obtained from MSigDB (Broad Institute). They are:

MSigDB_C2_Coates_Macrophage_M1_vs_M2_UP,

MSigDB_C2_Coates_Macrophage_M1_vs_M2_DN,

MSigDB.REACTOME.ADAPTIVE_IMMUNE_SYSTEM,

MSigDB.REACTOME.INNATE_IMMUNE_SYSTEM from MSigDB (Broad Institute).

For each gene, the fold change was calculated for each post-stroke time point vs the pre-stroke value using DESeq normalized read counts and followed by log2 transformation.

Supplementary Table I. A complete gene list by each cluster in the contralateral and ipsilateral hemisphere and the expression of innate immune, adaptive immune, M1, and M2, genes across time points in the ipsilateral stroked brain hemisphere. M1, M2, Adaptive and Innate immune gene lists were obtained from MSigDB (Broad Institute). They are:

MSigDB_C2_Coates_Macrophage_M1_vs_M2_UP,

MSigDB_C2_Coates_Macrophage_M1_vs_M2_DN,

MSigDB.REACTOME.ADAPTIVE_IMMUNE_SYSTEM,

MSigDB.REACTOME.INNATE_IMMUNE_SYSTEM from MSigDB (Broad Institute).

For each gene, the fold change was calculated for each post-stroke time point vs the pre-stroke value using DESeq normalized read counts and followed by log2 transformation.

* Preclinical Checklist

Preclinical Checklist: Prevention of bias is important for experimental cardiovascular research. **This short checklist must be completed, and the answers should be clearly presented in the manuscript.** The checklist will be used by reviewers and editors and it will be published. See "[Reporting Standard for Preclinical Studies of Stroke Therapy](#)" and "[Good Laboratory Practice: Preventing Introduction of Bias at the Bench](#)" for more information.

This study involves animal models:

Yes

Experimental groups and study timeline

The experimental group(s) have been clearly defined in the article, including number of animals in each experimental arm of the study: Yes

An account of the control group is provided, and number of animals in the control group has been reported. If no controls were used, the rationale has been stated: Yes

An overall study timeline is provided: Yes

Inclusion and exclusion criteria

A priori inclusion and exclusion criteria for tested animals were defined and have been reported in the article: Yes

Randomization

Animals were randomly assigned to the experimental groups. If the work being submitted does not contain multiple experimental groups, or if random assignment was not used, adequate explanations have been provided: Yes

Type and methods of randomization have been described: Yes

Methods used for allocation concealment have been reported: N/A

Blinding

Blinding procedures have been described with regard to masking of group/treatment assignment from the experimenter. The rationale for nonblinding of the experimenter has been provided, if such was not feasible: N/A

Blinding procedures have been described with regard to masking of group assignment during outcome assessment: N/A

Sample size and power calculations

Formal sample size and power calculations were conducted based on a priori determined outcome(s) and treatment effect, and the data have been reported. A formal size assessment was not conducted and a rationale has been provided: Yes

Data reporting and statistical methods

Number of animals in each group: randomized, tested, lost to follow-up, or died have been reported. If the experimentation involves repeated measurements, the number of animals assessed at each time point is provided, for all experimental groups: Yes

Baseline data on assessed outcome(s) for all experimental groups have been reported: Yes

Details on important adverse events and death of animals during the course of experimentation have been provided, for all experimental arms: Yes

Statistical methods used have been reported: Yes

Numeric data on outcomes have been provided in text, or in a tabular format with the main article or as supplementary tables, in addition to the figures: Yes

Experimental details, ethics, and funding statements

Details on experimentation including stroke model, formulation and dosage of therapeutic agent, site and route of administration, use of anesthesia and analgesia, temperature control during experimentation, and postprocedural monitoring have been described: Yes

Different sex animals have been used. If not, the reason/justification is provided: Yes

Statements on approval by ethics boards and ethical conduct of studies have been provided: Yes

Statements on funding and conflicts of interests have been provided: Yes

Date completed: 04/28/2020 14:46:31
