74

1.0 Supplementary Methods

1.1 GATHER compliance

Refer to Supplementary Table 1 for information on how this study meets GATHER compliance criteria[1].

1.2 Definitions

1.2.1 Routine first dose of measles-containing vaccine coverage

Routine coverage of the first dose of any measles-containing vaccine (MCV1), including measles-rubella and measles-mumps-rubella combination vaccines, was defined as the proportion of children born in a given year who received at least one dose of any measles-containing vaccine through routine immunisation services after reaching the target age for immunisation. In keeping with WHO/UNICEF Estimates of National Immunization Coverage (WUENIC) definitions of MCV1 coverage, our MCV1 coverage indicator reflects country-specific population schedules[2]. For countries recommending the first dose of a measles-containing-vaccine for children < 12 months old, the youngest (target age) cohort used to assess coverage in this analysis is 12–23 months old. If the first dose is not recommended until at least 12 months of age, the youngest (target age) cohort used to assess coverage is 24–35 months old. For a full list of schedules by country, please refer to Supplementary Table 2. We have included children among the target age cohort and the cohorts 1 and 2 years older than the target cohort at the time of survey. We excluded children that were 3 years older than the target cohort at the time of survey. We have tested this assumption in a sensitivity analysis that can be found in Supplementary Information section 2.2.

We assign coverage from each birth cohort of children surveyed to the year in which they were aged 0–12 months for modelling, in alignment with the methods used by WUNEIC and estimates from the Global Burden of Diseases, Injuries, and Risk Factors study (GBD). The WUENIC and GBD national-level coverage estimates both additionally incorporate administrative and/or official country-reported data on MCV1 coverage, which does not routinely collect nor report information on the precise birth cohort that accompanies the country-reported values of coverage. In order to maintain comparability with these national-level estimates, and because our estimates are calibrated to those produced by GBD, we adopt the same methodology for birth cohort assignment.

We considered children to have been vaccinated with MCV1 based on evidence from either home-based record (i.e., vaccination card) or parental recall. As with all survey-based measures of vaccination coverage, however, the use of data from parental recall could result in recall bias. Because recall bias of vaccination status varies in both direction and magnitude, we were unable to adjust for this bias[3], a limitation of this analysis.

In order to inform policy decisions regarding measles immunisation strategies, the ability to distinguish between the performance of routine immunisation services and supplemental immunisation activities is key. For instance, SIAs may reach unimmunised children across wealth quintiles more equitably than RI[4], but SIAs may be more vulnerable to disruption due to funding challenges, disasters, or political shifts. Currently, routine immunisation services are still recommended globally in the era of COVID-19[5]04/12/2020 14:14:00 and serve as the primary mechanism through which measles vaccination will be delivered in most settings during the pandemic, given COVID-19-related disruptions to planned SIAs. As the Global Measles and Rubella Strategic Plan suggests, RI services are meant to serve as the cornerstone of measles immunisation in all countries[6].

In this study, we therefore aim to model routine immunisation coverage, within the limits of the available data. To accomplish this aim, we included doses of MCV1 only from routine immunisation wherever possible when processing survey microdata, in order to minimise inclusion of doses administered in supplemental immunisation activities (SIA). See Supplementary Information section 1.3.4 for details on the removal of SIA doses during our data processing. This approach to estimating routine immunisation coverage is concordant with that used in other recent published studies[7] on routine MCV1 coverage. Due to inherent limitations in the underlying survey data, however, some SIA doses are still

likely to be misclassified as routine despite this process – particularly those from recall and from surveys where coding of SIA doses may have been inconsistent. While we aim to produce as representative an estimate of routine MCV1 coverage as possible, estimates presented in this manuscript should be interpreted in the context of this limitation.

1.3.2 Low- and middle-income countries

We defined low- and middle-income countries (LMICs) based on Socio-Demographic Index (SDI), as estimated in 2019 by the Global Burden of Diseases, Injuries, and Risk Factors Study (GBD)[8]. This metric combines education, fertility and income to summarise development. A country was included in our analysis if was in the bottom three quintiles and therefore having a low (0–0.455), low-middle (0.455–0.606), or middle (0.606–0.688) classification. Additionally, we included countries if they were part of the 94 Decade of Vaccine priority countries regardless of their SDI classification[8,9,10]. For the full list of included countries (with the exception of Jordan, neither classified as low- or middle-income or a DoV priority country, which was added to increase geographic continuity), refer to Supplementary Table 3.

1.3 Data

1.3.2 Data seeking

An overview of the entire data preparation and geospatial modelling process can be found in Extended Data Fig. 1. We searched the Global Health Data Exchange[11] (GHDx) for sources with the key word "vaccine," "measles vaccines," "MMR vaccines," "mumps vaccines," "rubella vaccines," "vaccination cards," or "immunisation" for all LMICs . Sources included in models of coverage are listed in Supplementary Fig. 1 and Supplementary Table 4. We gathered a total of 354 surveys for use in final analysis.

1.3.2 Inclusion and exclusion criteria for data sources

Data sources considered for inclusion were those for all LMICs containing subnationally-resolved information on MCV1 coverage. Surveys were included if they contained information on children between 12 and 59 months old, precise GPS coordinates or areal geographic boundaries and survey design variables, such as strata and weight.

National-level time series of survey estimates were examined to assess systematic survey bias[2]. When the estimates of a particular source appeared implausible in the context of other data or external information on the reliability of that source, the survey methodology, case definitions, and data collection for that source were evaluated, along with the underlying spatial patterns of the original survey data. Sources assessed as implausible or with known methodological flaws were excluded from the modelling process and are listed in Supplementary Table 5.

1.3.3 Final list of countries included in analysis

For 13 countries (Bhutan, Brazil, China, Dominica, Georgia, Grenada, Libya, Oman, Palestine, Saint Lucia, Saint Vincent and the Grenadines, Seychelles, and Venezuela), no available subnational vaccine coverage data met the inclusion and exclusion criteria and therefore have been excluded from this analysis.

1.3.4 Data preparation

The following data were extracted from each survey source: vaccine card or home-based record (HBR) doses, parental recall vaccine doses, age (in months), survey weight and design variables, and GPS-cluster or areal location. Individuals with evidence of vaccination either from HBR or recall were considered to

have been vaccinated. Individuals were excluded from the analysis if they were missing age, spatial, or survey design information or were outside of the study age or year range. The study included all years between 2000 and 2019. A comprehensive overview of data from all study geographies included can be found in Supplementary Fig. 2.

Individual age, in months, at the time of survey collection was used to assign each child to a birth cohort (12–23 months, 24–35 months, 36–47 months, and 48–59 months). Data corresponding to each birth cohort were included in the modelling process in the year in which that birth cohort was aged 0–12 months old[12]. This method allows the inclusion of additional individuals, which increases overall geographical representation, but requires assumptions such as negligible catch-up vaccination and no differential mortality or migration. However, the influence of including older cohorts in our model on the key findings appeared to be minor (Supplementary Information section 2.2).

Wherever possible, we removed doses recorded on vaccination cards or from parental recall that were attributable to SIAs. First, we reviewed the underlying survey methodology to identify, where applicable, the coding used to identify doses delivered through SIAs rather than routine immunisation services. We confirmed the occurrence of each SIA by cross-referencing the summary documentation of historical SIAs compiled by WHO[13]. For children who participated in a SIA and had card or recall codes that indicating doses which were attributable to the campaign, we excluded those doses from our analysis of routine immunisation coverage. For surveys for which SIA doses were not identified through coding on vaccination cards or in specific recall survey variables, we were not able to make this distinction, reflecting an inherent limitation in data collection and recording from the underlying survey data.

1.3.5 Geographic positioning of GPS-located clusters and areal location data

Individuals were assigned to the most granular geographic location possible. Antigen-dose-specific coverage at each of these locations, either GPS-located cluster or an areal location, was calculated. The mean MCV1 coverage was calculated at the most precise geographic location possible. Survey weights were taken into account using the Kish adjustment when calculating averages for areally assigned data. Data without GPS information were matched to the most precise geographic location possible using a library of boundary definitions largely composed of shapefiles from individual surveys, the Global Administrative Unit Layers database, the Database of Global Administrative Areas, and other country-specific shapefiles. If the smallest geographic unit available was smaller than a 5 × 5-km pixel, the unit was assigned to a GPS-located cluster at the centroid of the pixel.

To be included in the model-based geostatistical framework, all data must be geo-located at the precision of a specific latitude and longitude coordinate pair. For areally located data that has been matched to an administrative unit but for which no GPS coordinates were available, we used a previously described method to generate a set of candidate cluster locations where survey sampling could plausibly have occurred, using population weights and k-means clustering[14] (Supplementary Fig. 3). In brief, 10,000 points were randomly sampled from the area within the administrative boundary that was matched to the areal data. Points were sampled proportionally to the total population within that space and time as estimated by the WorldPop population raster[15]. A set of integration points (1 per 1,000 5 × 5-km pixels) was generated via k-means clustering, representing candidate locations of survey sampling under the assumption that each survey sampled locations proportional to population. These integration points were used as input locations for the areal data in the geospatial model. Each integration point was assigned the mean MCV1 coverage value previously calculated for the entire areal location. A weight was also assigned to each integration point (i.e., candidate observation location) that is proportional to the number of randomly sampled points that were included in the k-means cluster, such that all weights sum to 1 for each areal data observation. The "survey" package in R[16] was used to determine a conservative sample size for the entire areal unit, and the sample size at each integration point was determined using this calculated total sample size and the weights of each integration point. Overall, this method produces a set of candidate observations of vaccine coverage spread over the area in question, with increased weight given to locations that are more densely populated.

1.3.6 Geospatial covariate selection

We used a variance inflation factor (VIF) algorithm for geospatial covariate selection before using the subsequent covariates in child models. We chose to use a covariate selection algorithm before fitting child models to remove collinear covariates to facilitate model convergence. For each coordinate point where data is located, geospatial covariate values were extracted. The VIF algorithm works by computing the variance of each covariate, which is conflated when multicollinearities exist in the covariate values[17]. The VIF was computed for each covariate, removing the largest incrementally, until the VIF for each remaining covariate was less than 3. This algorithm was run for all modelling regions (as discussed in Supplementary Information section 1.4.1).

1.4 Modelling methods

1.4.1 Geographic modelling regions

Coverage was modelled in 13 continuous geographic regions, and the outputs of these regional models were combined to create comprehensive maps of antigen-dose-specific coverage in LMICs. Countries were assigned to one of 13 regions. Regions were decided by adapting regions defined by GBD, which are constructed to group countries together by epidemiological similarity and geographical proximity (Extended Data Fig. 2). We modified these regions to ensure geographical contiguity. We included a one-degree buffer to each region when modelling to ensure minimal effects of regional edges in final results. Computationally, it is much more efficient to fit multiple regions in parallel that are smaller in area. Additionally, fitting models in separate regions allows for different regional relationships in coverage with geostatistical covariates.

1.4.2 Stacked generalisation child models

Stacked generalisation is an ensemble method for combining models and has shown to increase predictive accuracy in spatiotemporal disease modelling[18]. We use stacked generalisation in our modelling framework to combine predictions of our child models (lasso, GAM and boosted regression trees) for three main reasons. First, its use allows us to increase our predictive accuracy, although they reduce the causal interpretation of the subsequent results. Next, as not many geospatial covariates largely explain vaccination coverage, stacked generalisation maximise the predictive power of the covariates we do have. Third, staked generalisation allows us to account for the complex, non-linear relationships between covariates and outcomes in our model.

The choice of using stacked generalisation breaks the ability for our model to be used to describe any causal pathway. Ideally, models would be optimised for prediction and causal inference. However, as our objective is predictive accuracy rather than causal inference, we believe that the benefits of inclusion of a stacked generalisation step outweigh this limitation.

1.4.3 Geospatial model priors

The following priors were used for modelling MCV1 coverage:

$$\beta_0 \sim \mathrm{N}(\mu = 0, \sigma^2 = 3^2),$$

$$\beta_h \sim^{iid} \mathrm{N}(\mu = 0, \sigma^2 = 3^2),$$

$$\log\left(\frac{1+\rho}{1-\rho}\right) \sim \mathrm{N}(\mu = 0, \sigma^2 = 1/0.15),$$

$$\frac{1}{\sigma^2_{nugget}} \sim \mathrm{loggamma}(\alpha = 1, \gamma = 2),$$

$$\frac{1}{\sigma^2_{ctry(i)}} \sim \mathrm{loggamma}(\alpha = 1, \gamma = 2),$$

For the Matérn function, we used a penalised complexity prior for the range, δ, such that $P(\delta < \boldsymbol{\delta_0}) < 0.05$, and standard deviation, σ^2_{space}, such that $P\left(\sigma^2_{space} > 3\right) = 0.05$. $\boldsymbol{\delta_0}$ was chosen such that it was ~ 5% of the region size[19].

1.4.4 Spatial mesh construction

The SPDE approximation to the residuals of the Gaussian process requires the construction of a finite spatial elements mesh for each modelling region in order to fit the spatiotemporal correlated error term in the generalised linear modelling framework. A spherical finite mesh was constructed for each modelling region using edge-smoothed polygon boundaries; the inner mesh triangle edge length ranges from 25 to 500 km and the outer mesh edge length is 1000 km. For an example mesh, see Supplementary Fig. 5. With this type of spatial mesh, the spatial distance matrix as part of the Matérn covariate, was calculated using the greatest circle distance along the surface of the sphere (i.e. Earth).

We define the SPDE on $\mathbb{S}^2$, a spherical manifold, and use the great circle distance as described in the SPDE framework. Practically, this is implemented in our modelling pipeline by first converting data locations and geographic region boundaries to three-dimensional coordinates on the unit-sphere. Next, using the INLA "inla.mesh.create" function, we construct an $\mathbb{S}^2$, mesh using the three-dimensional data and boundaries.

1.4.5 Model fitting

Models were fit using R-INLA as described previously[14]. We have chosen to use R-INLA for model fitting and interpretation to leverage its computational tractability when running models across large spatial scales. This is possible through maximising computational efficiency via an inherent parallelising structure to exploit multi-core processing and also generalising across latent Gaussian models which allows for a significant amount of inference to be automated.

Cluster-level observations for which precise latitude and longitudinal coordinates are known were assigned a weight of 1. Areal data that was resampled as described above were given weight as a function of the K-means clustering process. These weights were used in the R-INLA fitting process to ensure both observation types were given equal contribution to the log-likelihood function of the model.

During model fitting, we apply a linear sum to 1 constraint on the child model β_c's using the "extraconstr" argument of R-INLA[20], such that:

$$A\boldsymbol{\beta}_{\mathbf{c}}^{\top} = \mathbf{e}^{\top}$$

where A is a matrix of dimensions (1,1, length of vector of the fixed effects (i.e. 3)) and e = 1.

Model fitting parameters can be found in Supplementary Table 8. The posterior is numerically approximated as part of the INLA approach and thus convergence cannot be assessed in a comparable way as with a full MCMC sampler. As an alternative, we used the R-INLA "inla_results$mode$mode.status" function to ensure that the INLA results have identified the posterior modes of the hyperparameters and the associated Hessian is positive definite. This check was passed for all modelled regions.

1.4.6 Additional modelling parameters and limitations

We modeled using AR(1) temporal structure; alternative approaches could provide more flexibility, but in practice we find that this works adequately given subsequent out-of-sample model performance. Selection of optimal spatiotemporal covariance structures for vaccine coverage modeling is an important area for further investigation in future work. Also, we used a model that is separable in space and time. While this assumes that the covariance between years and locations has the same functional form regardless of the locations. Fitting a non-separable model would be complex and computationally challenging and should also be considered in future work.

1.5 Post-estimation calibration and figure production

1.5.1 Production of GBD coverage estimates

Using the results of the geostatistical modelling process above, we calibrated our set of posterior draws to estimates of MCV1 coverage from GBD 2019[8]. The geostatistical model described above uses only subnationally-resolved survey data, while coverage estimates produced by GBD 2019 additionally leverage surveys for which only national-level data are available as well as bias-adjusted national-level administrative data. This calibration step allows our geospatial estimates to reflect national-level trends in coverage that are informed by national-level surveys and administrative data, while preserving the relative spatial patterns estimated by the geospatial model. GBD 2019 produced coverage estimates for 11 vaccine antigen-dose combinations in 204 national and 858 subnational locations from 21 countries from 1980 to 2019. Coverage indicators represent the same indicators as in the geospatial models, which is the proportion of children in the target age population receiving MCV1, as previously described.

Data from household surveys, administrative reports of coverage, and other survey reports and tabulations are used to produce GBD coverage estimates. The GHDx and targeted country searches were used to identify all nationally-representative sources containing information on vaccine coverage. Household survey series used include the Demographic Health Survey (DHS) series, Multiple Indicator Cluster Survey (MICS) series, Reproductive Health Survey (RHS) series, and Living Standards Measurement Study (LSMS) series. Appropriate survey weights were applied to generate weighted national estimates of coverage, and accompanying uncertainty was calculated from standard error and sample size.

Annual estimates of administrative immunisation coverage from the Joint Reporting Form (JRF) were collected. GBD applies a time-varying country- and vaccine-specific bias adjustment to account for changing degrees of bias in the JRF-reported administrative estimates over time[8]. The ratio of survey coverage to administrative estimates for paired points in the same year and location was modelled in a spatiotemporal Gaussian process regression (ST-GPR) using SDI as a predictive covariate. From this model, estimates of administrative bias were obtained for all locations and years, which were then used to adjust the administrative data prior to inclusion in the final vaccine coverage model.

GBD uses an ST-GPR model to estimate vaccination coverage by synthesising data from various sources while borrowing strength from data across time and space. This method produces a complete time series and accompanying uncertainty for each location and antigen-dose combination and has been widely used in many other GBD risk factors and causes. The ST-GPR model mean function can be summarised as:

$$m_c(t) = X\beta + h(r_{c,t}) \ ,$$

where $X\beta$ is a linear model and $h(r_{c,t})$ is a residual smoothing function, for each country c and each year t. In estimating vaccine coverage using ST-GPR, the following linear model was used:

$$logit(P_{c,t}) = \beta_0 + \beta_1 HAQI_{c,t} + \beta_2 war_{c,t} + \beta_3 stockout_{c,t} + \alpha_c + \gamma_{R[c]} + \omega_{SR[c]} + \varepsilon_{c,t} \ ,$$

where $P_{c,t}$ is vaccination coverage, $HAQI_{c,t}$ is health access and quality index[21], $war_{c,t}$ is mortality rate due to war and terror, and $stockout_{c,t}$ is a variable representing the magnitude of a stock-out as estimated by the logit-space difference between observed and expected administrative coverage for locations and years with a known antigen-specific vaccine stock-out, for each country c and each year t. α_c , $\gamma_{R[c]}$, and $\omega_{SR[c]}$ are country, GBD region, and GBD super-region random effects. Estimates were produced through ST-GPR regression steps with 1,000 random samples from the posterior distribution per country and year. Uncertainty intervals were taken from the 25th and 975th ordered posterior samples.

1.5.2 Figure production

All maps were generated using ArcMap 10.6 and Python 2.7[22,23]. Other figures were produced using R version 3.6.1[24].

2.0 Supplementary results and discussion

2.1 MCV1 coverage

We aggregated estimates to country and first and second administrative boundaries, and showed pixel-level maps for years 2000, 2005, 2010, 2015, and 2019 (Extended Data Figs 3-7). In 2019, pixel-level means and 95% uncertainty intervals for the full posterior distribution are shown in Supplementary Figs 14-16. These results for all years 2000 to 2019 are also available in the online visualisation tool, which can be found here: (https://vizhub.healthdata.org/lbd/mcv).

Additionally, to portray uncertainty, the Coffey-Feingold-Bromberg statistic[25] was used. This statistic provides a measure of the uncertainty in a set of draws of proportions that is comparable across different means and ranges from 0% indicating no uncertainty and 100% indicating highest possible uncertainty (Supplementary Fig. 17).

As the relationships between covariates and coverage are multi-dimensional, we used methods to account for these complex relationships. These methods are optimised for prediction, not inference, and this model therefore cannot be used to infer a causal relationship between any given covariate and vaccination coverage.

2.2 Age cohort selection sensitivity analysis

In this analysis, we include data from multiple age cohorts of surveyed children where available, including the target age cohort and older birth cohorts. Older children may be more likely to be vaccinated due to additional opportunities for vaccination, e.g. through catch-up routine immunisation services, inclusion in additional supplemental immunisation activities, or through a second opportunity for first-dose immunisation during the second year of life in countries that have introduced MCV2. Alternatively, older cohorts may have lower coverage in some cases than younger cohorts in a given survey, due to – for instance – rapidly increasing trends in immunisation coverage. The inclusion of older children in the model, therefore, has the potential to introduce bias. If this bias is negligible, however, exclusion of older children would remove potentially informative observations of coverage across space and time from the model. To determine which cohorts of children should be included in our model, we therefore conducted a series of regression and sensitivity analyses to assess for potential bias and evaluate the influence of these decisions on the key findings of this study.

First, we conducted an analysis of cohorts of children for which we have multiple observations of vaccine coverage from surveys conducted at different points in time. We chose this approach because simply looking at coverage by cohort within a given survey presents an age-period-cohort problem, where the effects of changing coverage by age and changing coverage within a country over time are difficult to disentangle. By analysing cohorts with multiple survey observations, we could compare survey estimates of coverage for the cohort obtained at the time in which they were the target age and in at least one other year, for instance when the children were one year older than the target age (t+1), two years older than the target age (t+2), or three years older than the target age (t+3). We evaluated the effect of the time lag between survey observations for a given birth cohort using the following regression analysis, which yielded the results shown in Supplementary Information Table 14:

$$\ln\left(\frac{coverage\ observed\ when\ cohort\ was\ older\ than\ target\ age}{coverage\ observed\ when\ cohort\ was\ of\ the\ target\ age}\right) = I_{t+1}\beta_1 + I_{t+2}\beta_2 + I_{t+3}\beta_3$$

There was a significant effect for the indicator variable for the largest (t+3) time lag between observations for a given cohort. Therefore, these oldest cohorts, i.e. those that were 3 years older than the target age group, were removed from our data set.

However, to ensure major themes of this work were not sensitive to choice in age cohort, we ran three additional versions of the models: a model including all cohorts from each survey, a model with the target age cohort along with t+1 and t+2 cohorts (the approach presented in the main text, figures, and tables), a model with only the target age cohort and the t+1 cohort, and a model with only the target age cohort. The results and major findings of this work did not sustainably change among the four cohort versions (Supplementary Table 15, Supplementary Figs. 18-20).

2.3 Changes in coverage sensitivity analysis

If a district has high starting coverage, there is less room for improvement in coverage and a higher likelihood of stagnant coverage values. Therefore, we performed a sensitivity analysis of changes in coverage between 2000 to 2010 and 2010 to 2019 to account for baseline starting value. Including only districts with coverage below 90% in 2000, 82.2% (95% Uncertainty Interval (UI): 77.6–86.1%) of districts had increasing coverage from 2000 to 2010. Including only districts with coverage below 90% in 2010, 44.6% (95% UI: 38.3–53.4%) of districts had increasing coverage from 2010 to 2019. Our original trend presented therefore holds true in this supplementary analysis – coverage improved in fewer districts between 2010–2019 when compared to the time period 2000–2010.

3.0 Supplementary Figures

Supplementary Fig. 1: Household surveys included in modelling
All data are shown mapped to their corresponding geographic area. This is prior to candidate points being generated for areal data. The sample size represents the number of individual children included in the underlying microdata record for each survey. From 2000 to 2019, MCV1 data availability is shown for **a)** Caribbean, **b)** Central America, **c)** Central Asia and Eastern Europe, **d)** Central sub-Saharan Africa, **e)** East Asia, **f)** Eastern sub-Saharan Africa, **g)** North Africa and Middle East, **h)** Oceania, **i)** South America (Andean), **j)** South America (Tropical), **k)** South Asia, **l)** Southern sub-Saharan Africa, and **m)** Western sub-Saharan Africa. Countries excluded from this analysis due to lack of reliable survey data are shown in grey.

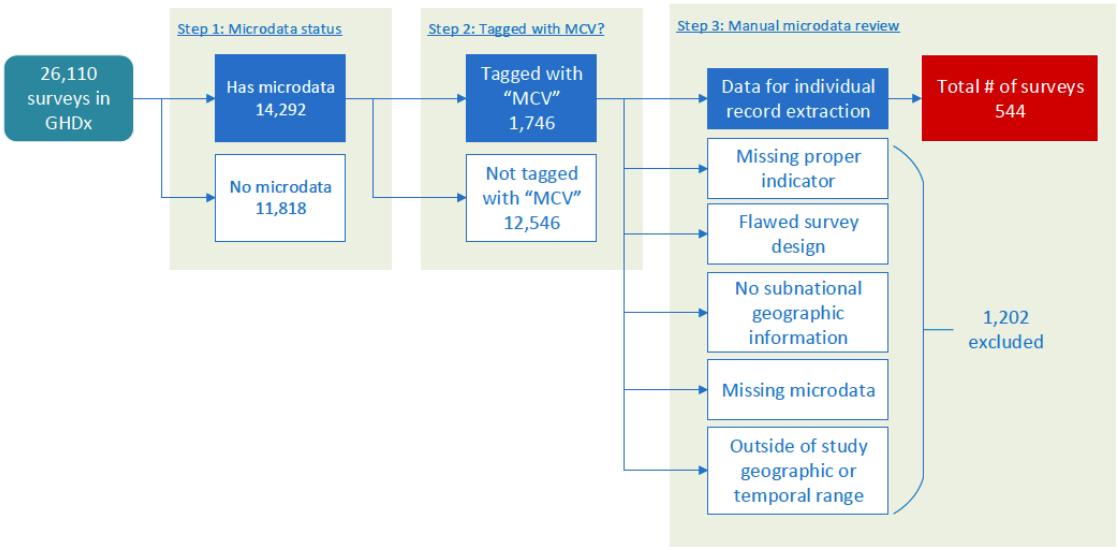
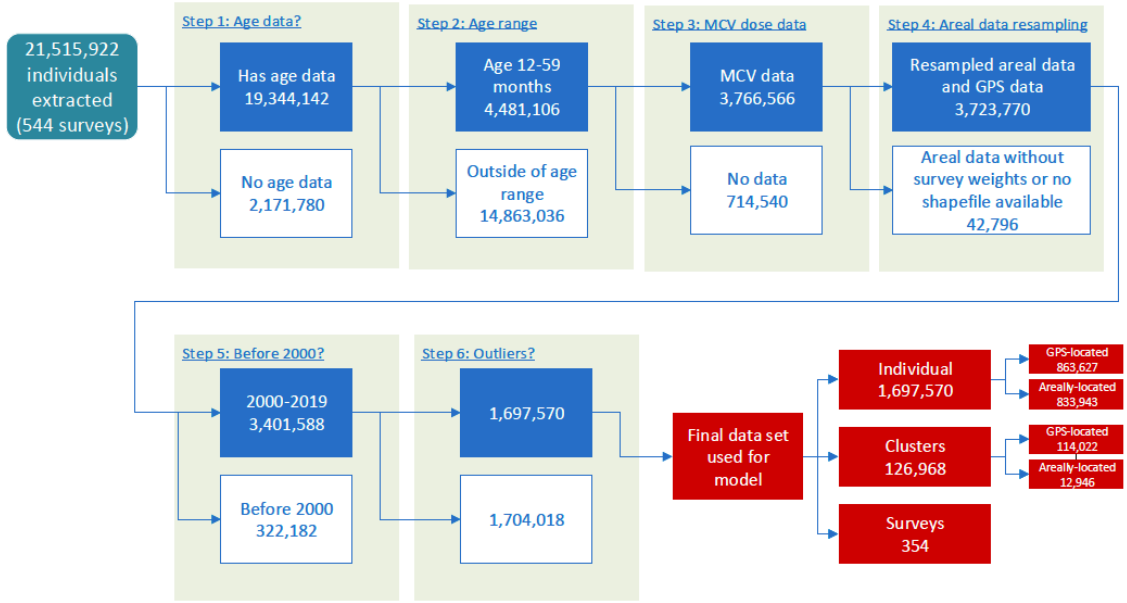
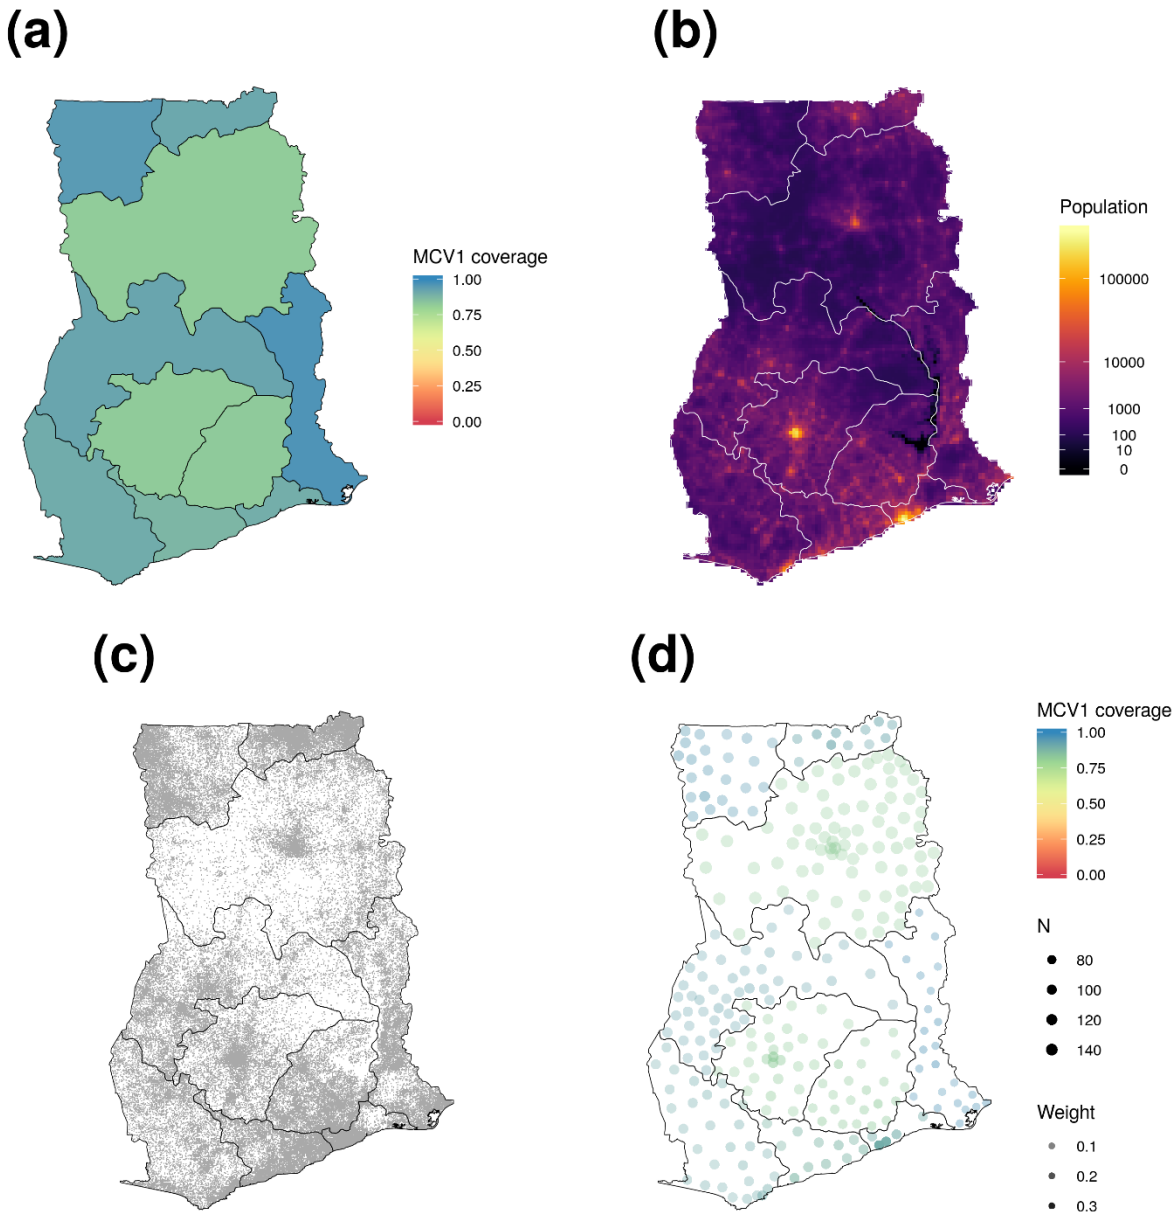
a.



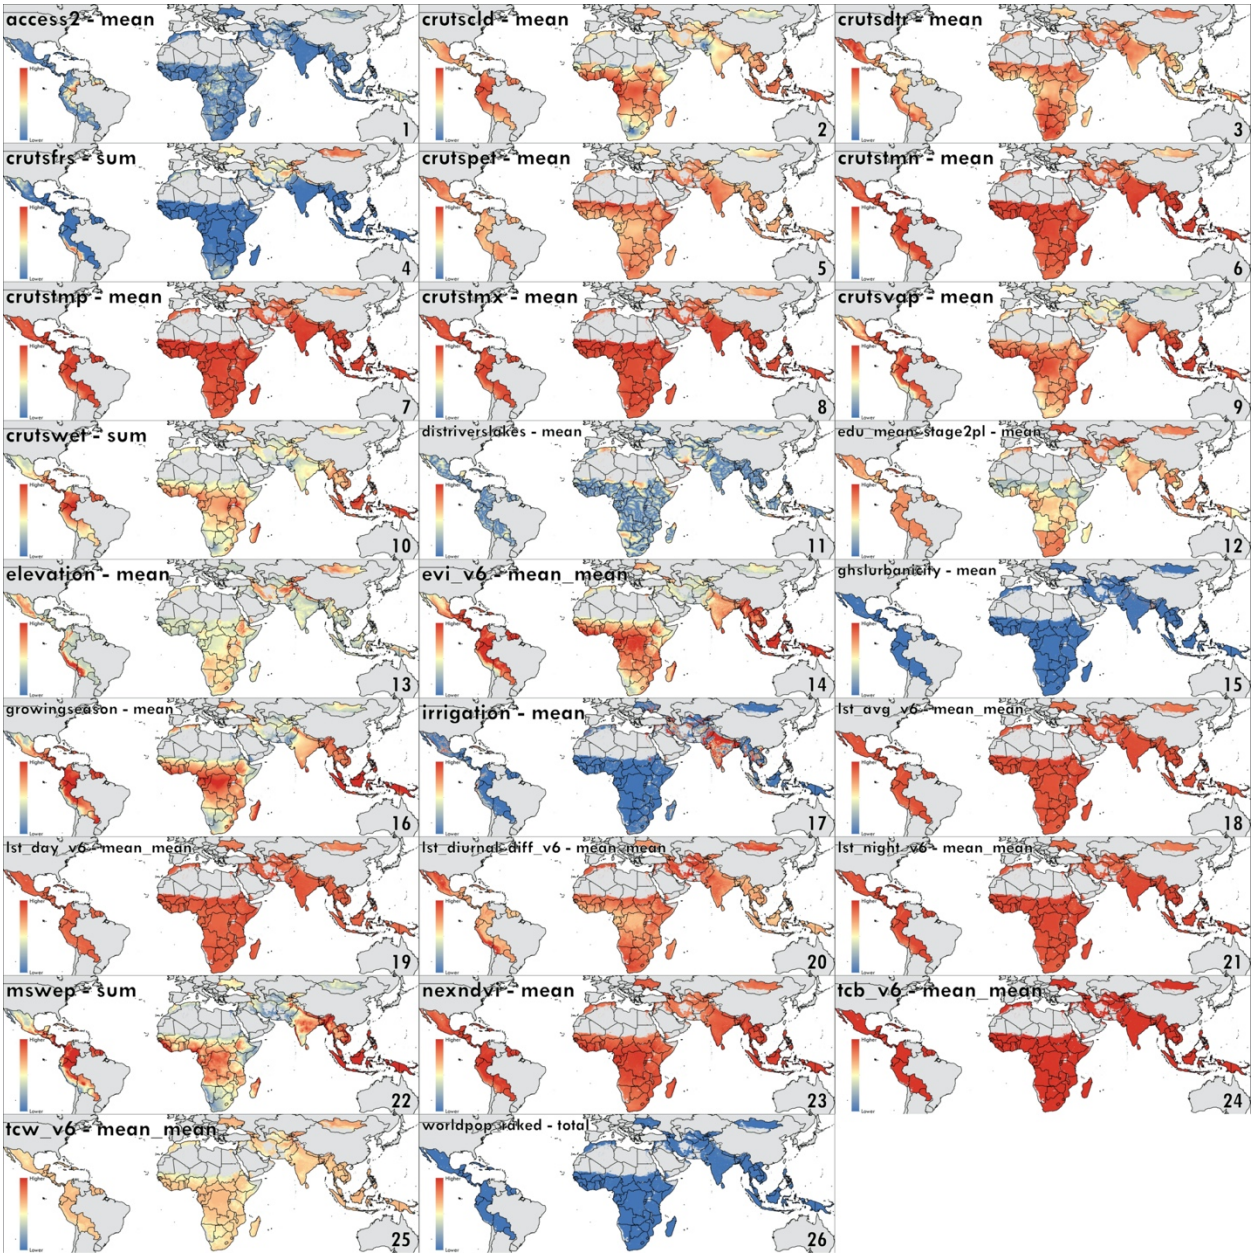
b.



Supplementary Fig. 2: Data inclusion flow chart
Survey identification from the GHDx and data loss during cleaning and processing is described below.[11] To be included in final analyses, data had to be within the countries included and within temporal range of the study, meet survey design standards, and contain individual-level microdata on age, MCV1 coverage, and subnational geographic location. Panel a indicates survey-level identification criteria and panel b indicates individual-level details after survey identification.

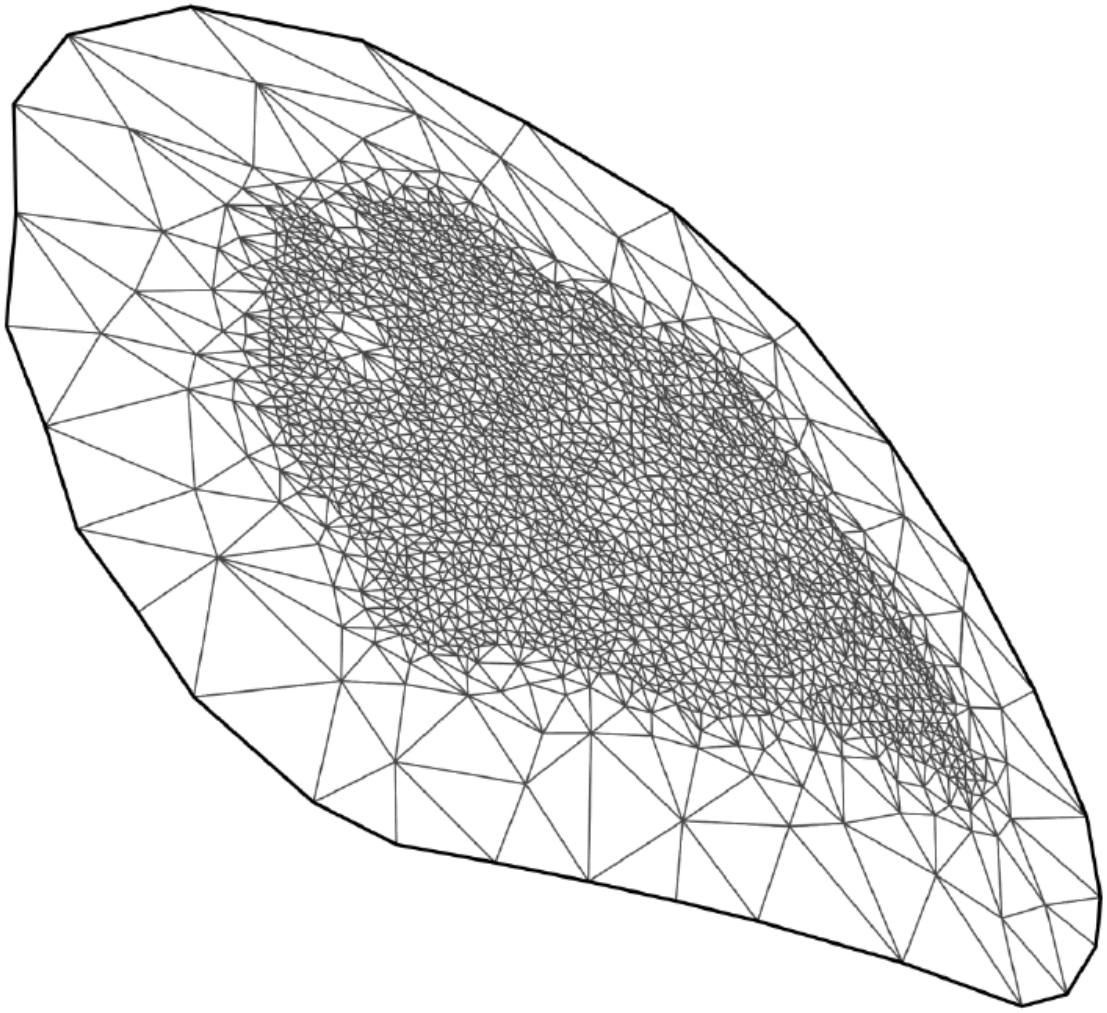


Supplementary Fig. 3: Areal data spatial resampling
Areal data was resampled for inclusion in the geospatial models using k-means clustering and underlying population weights, via weighted survey data estimates of MCV1 coverage for each areal unit in a given country-survey-year (panel a), population surface from WorldPop used during the resampling process (panel b), 10,000 randomly sampled points proportional to the underlying population weights of panel b (panel c), and weighted integration points following k-means clustering to be used in the geospatial model (panel d).



Supplementary Fig. 4: Geospatial covariates used in modelling
Twenty-six candidate geospatial layers of covariates possibly related to MCV1 coverage were selected for use in the stacked generalisation modelling process via a variance inflation factor selection algorithm per region. Individual covariates are cited in Supplementary Table 6. Covariates include the following, and are shown in 2019 or the most recent year available: access to roads [*access2*], cloud cover percentage [*crutscld*], mean diurnal temperature range [*crutsdtr*], frost day frequency [*crutsfrs*], mean potential evapotranspiration per day per month [crutspet], average daily minimum temperature [*crutstmn*], average daily mean temperature [*crutstmp*], average daily maximum temperature [*crutstmx*], mean vapour pressure [*crutsvap*], monthly wet day frequency [*crutswet*], distance from rivers or lakes [*distriverslakes*],

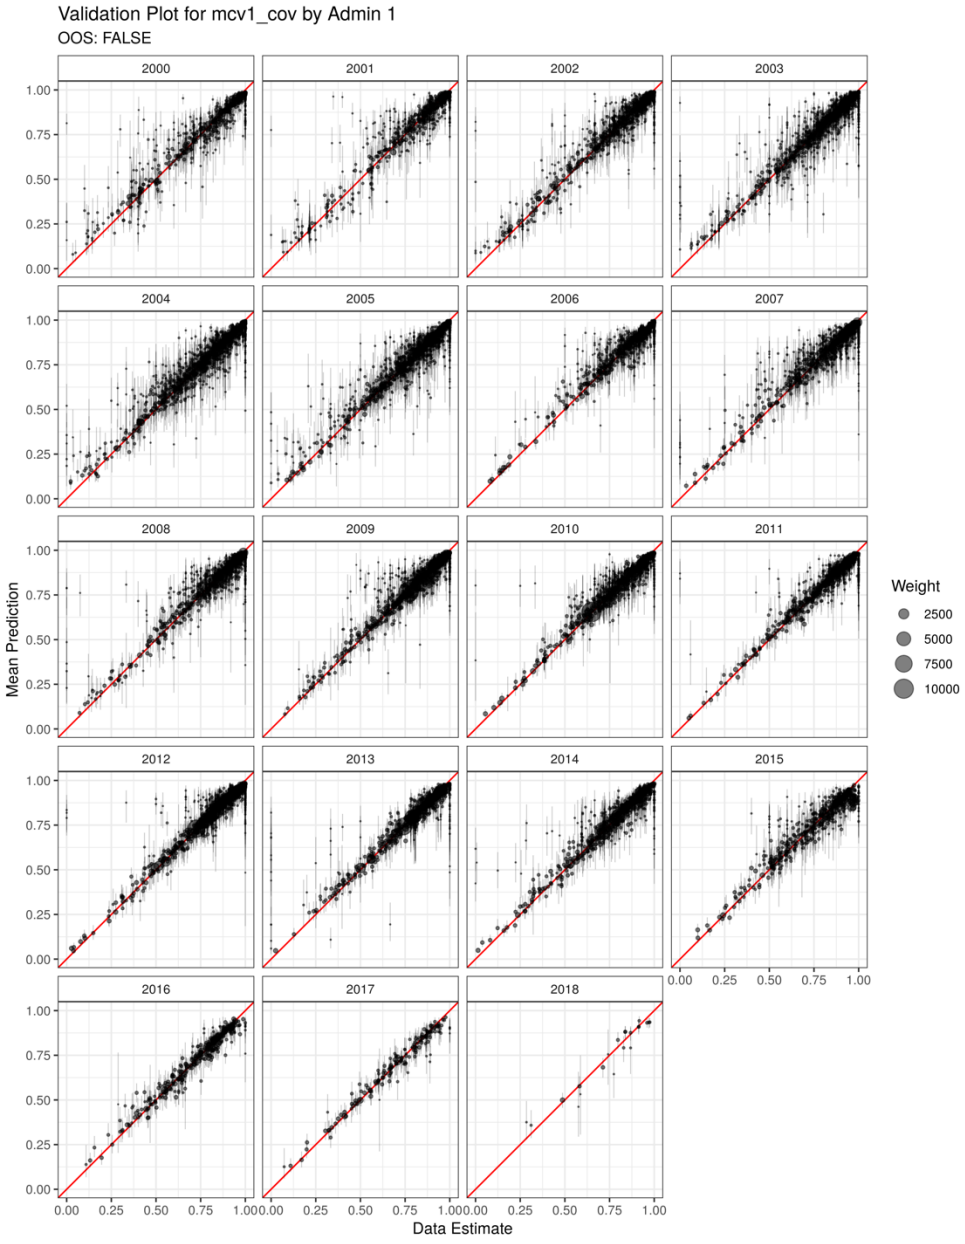
mean years of education among 15–49 year-old females (maternal education) [*edu-mean-stage2pl*], elevation [*elevation*], enhanced vegetation index [*evi_v6*], urban or rural [*ghsurbanicity*], length of growing season [*growingseason*], irrigation [*irrigation*], average land surface temperature [*lst_av_v6*], daytime land surface temperature [*lst_day_v6*], difference between daytime and nighttime land surface temperature [*lst_diurnal_v6*], nighttime land surface temperature [*lst_night_v6*], multi-source weighted-ensemble precipitation [*mswep*], normalised difference vegetation index [*nexndvi*], tasseled-cap brightness [*tcb_v6*], tasseled-cap wetness [*tcw_v6*], and total population [*worldpop_raked*]. Pixels that are grey in colour are either not included in the analysis, or have been classified by being "barren or sparsely vegetated" or had fewer than 10 people per 1 × 1-km pixel.[15,26]



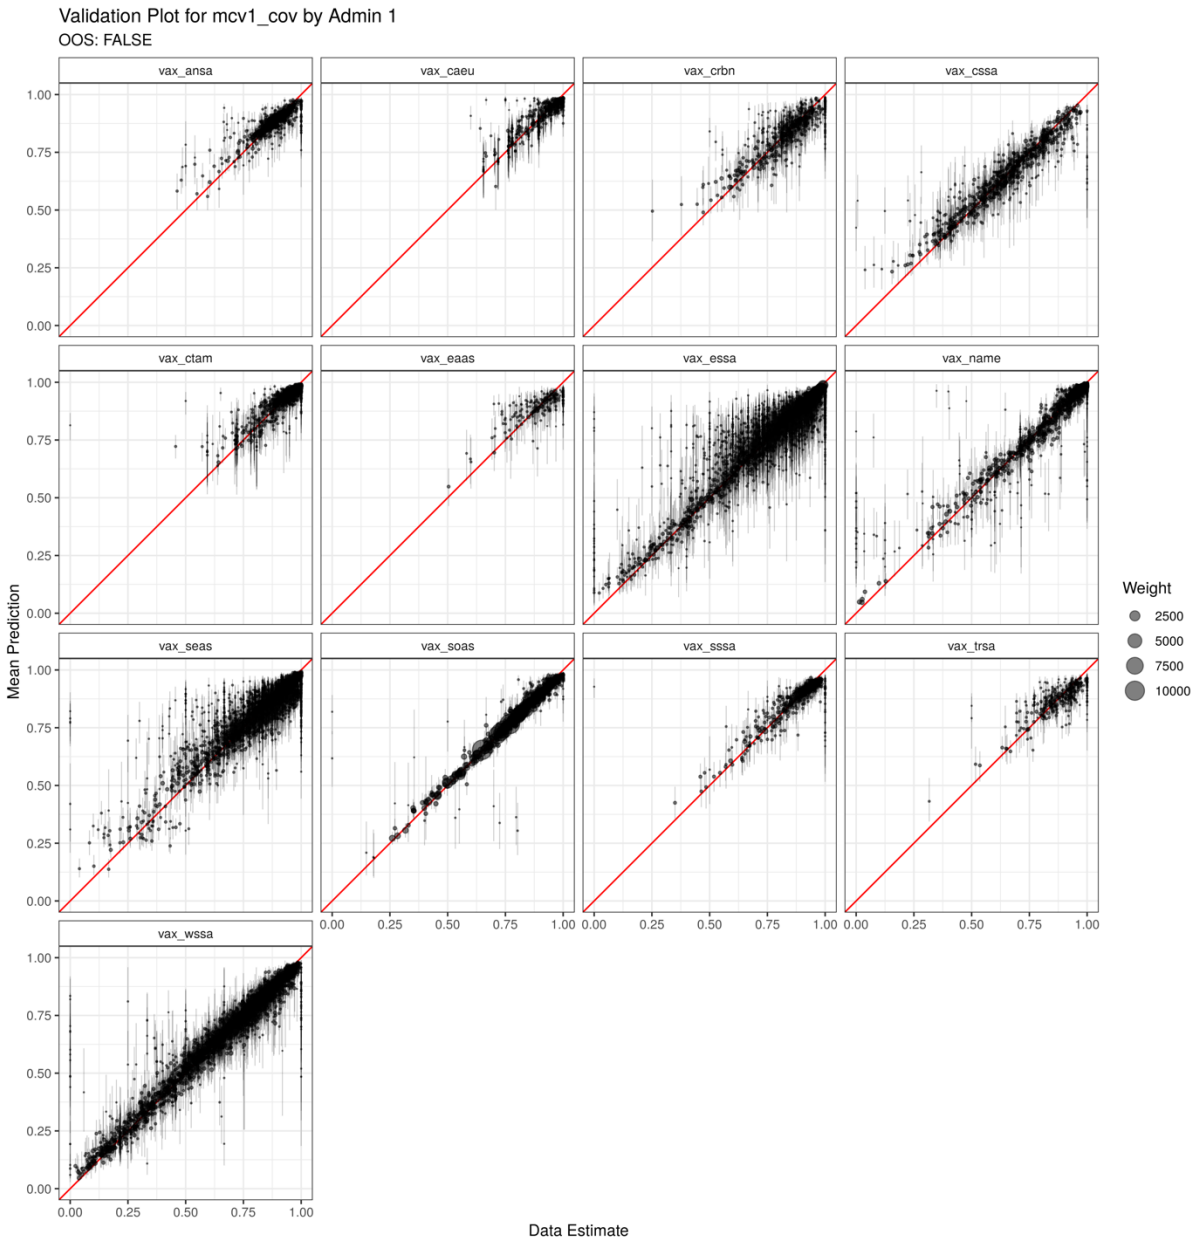
Supplementary Fig. 5: Example of finite spatial mesh

For the Southern sub-Saharan Africa region, the fine-scale mesh over land in the modelling region and the coarser buffer region are shown.

Supplementary Figs 6–7: First administrative level in-sample validation plots
For each plot, the survey data and mean posterior prediction of coverage are compared. The size per dot is proportional to the sample size in the underlying data. Estimates are shown by region and year. Since there were only data through 2018, the years included only span through 2018. Regions are labelled as the following: Andean South America [*vax_ansa*], Central Asia Eastern Europe [*vax_caeu*], Caribbean [*vax_crbn]*, Central sub-Saharan Africa [*vax_cssa*], Central America [*vax_ctam*], East Asia [*vax_eaas*], East sub-Saharan Africa [*vax_essa*], North Africa and Middle East [*vax_name*], South East Asia, [*vax_seas*], South Asia [*vax_soas*], Southern sub-Saharan Africa [*vax_sssa*], Tropical South America [*vax_trsa*], and Western sub-Saharan Africa [*vax_wssa*].

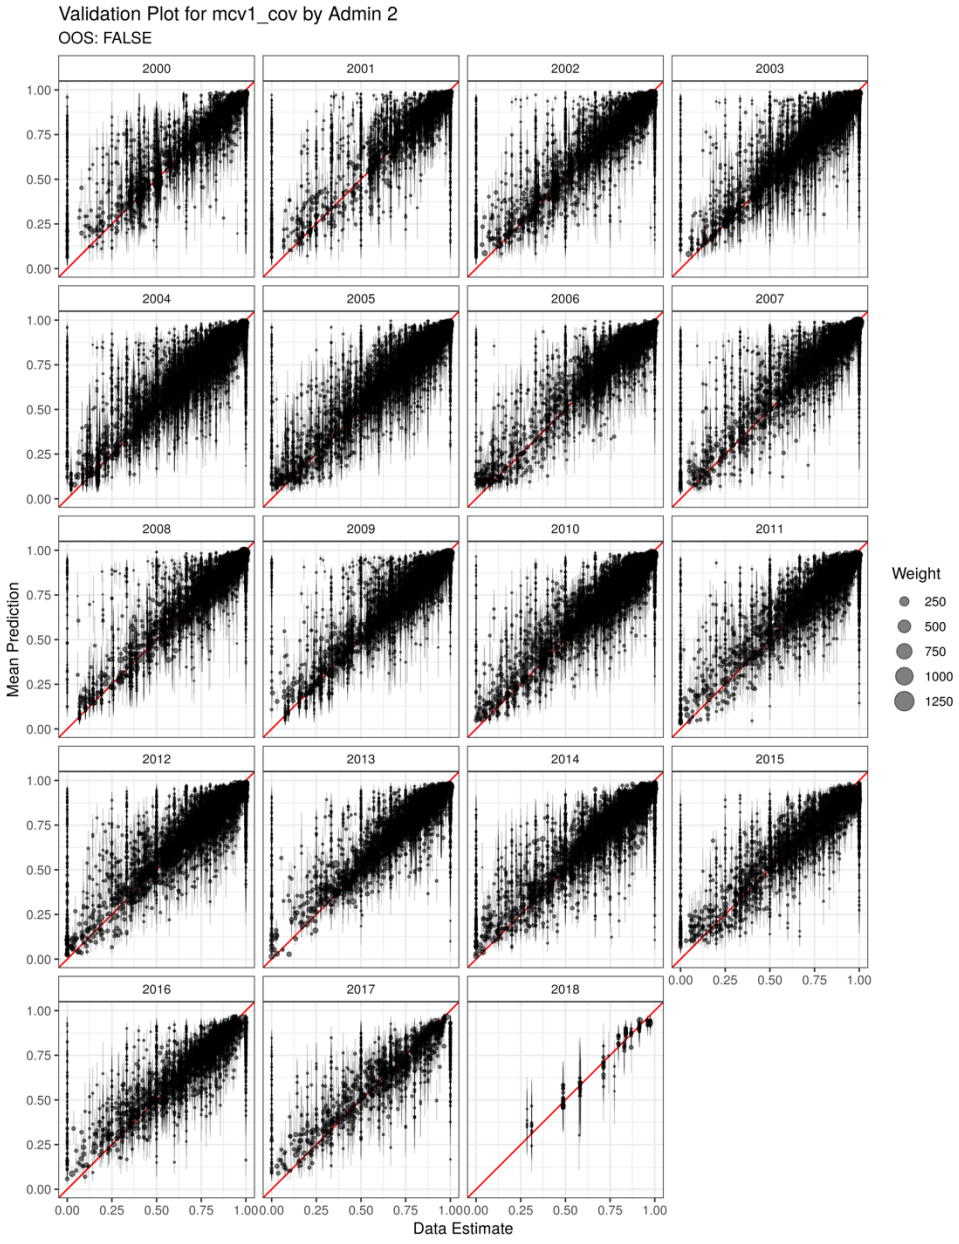


Supplementary Fig. 6: First administrative level, in-sample validation plot, by year

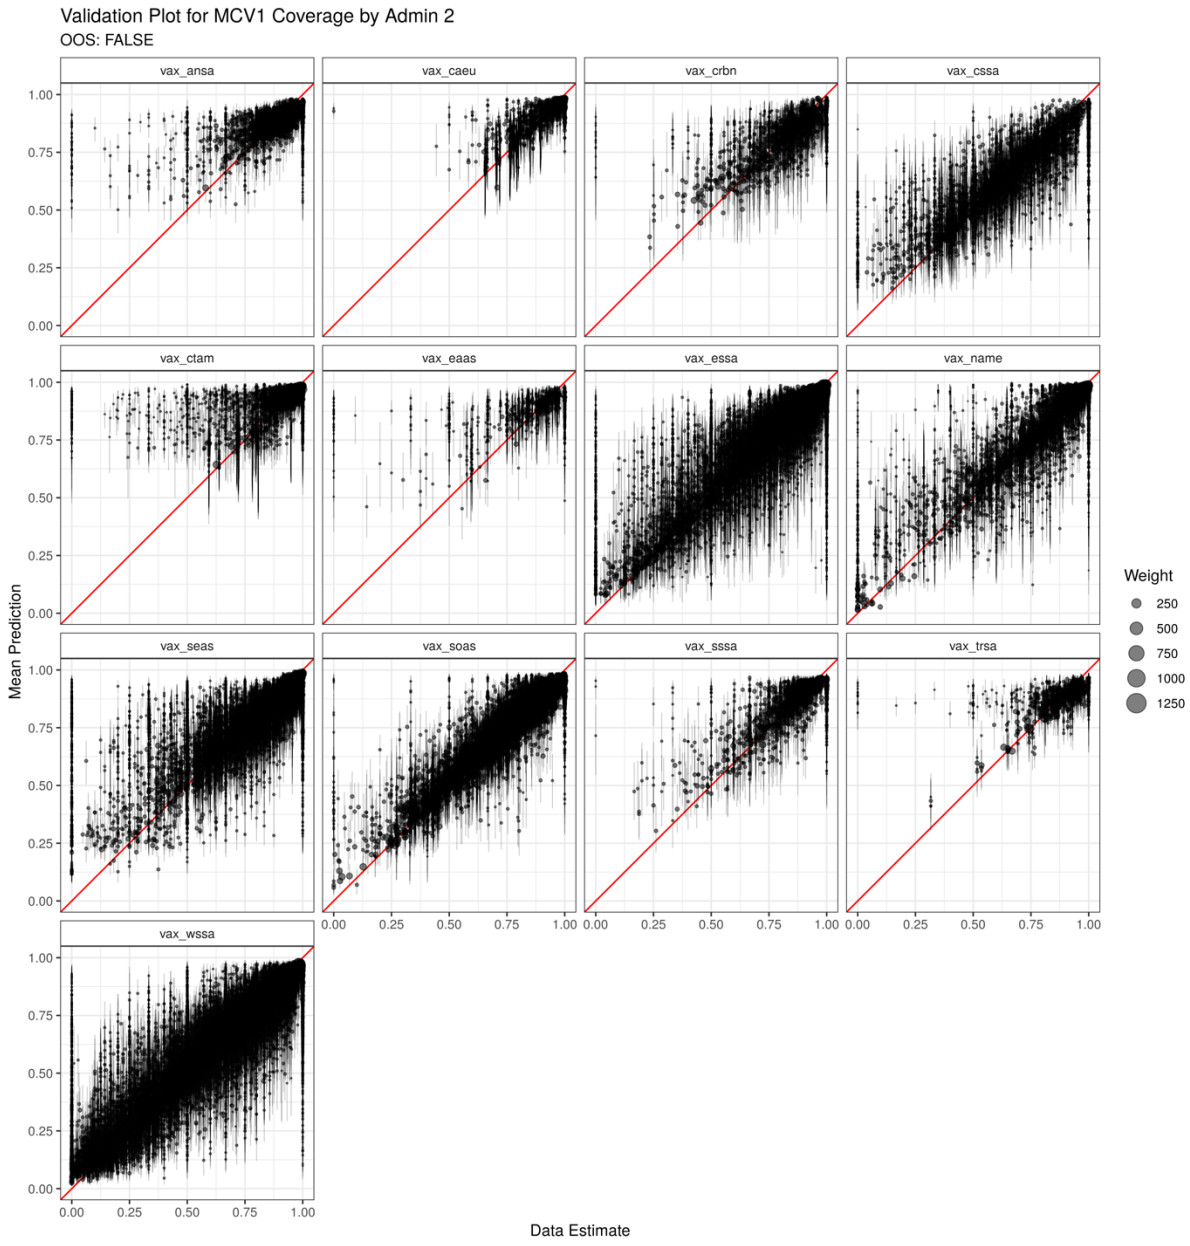


Supplementary Fig. 7: First administrative level, in-sample validation plot, by region

Supplementary Figs 8–9: Second administrative level in-sample validation plots
For each plot, the survey data and mean posterior prediction of coverage are compared. The size per dot is proportional to the sample size in the underlying data. Estimates are shown by region and year. Since there were only data through 2018, the years included only span through 2018. Regions are labelled as the following: Andean South America [*vax_ansa*], Central Asia Eastern Europe [*vax_caeu*], Caribbean [*vax_crbn]*, Central sub-Saharan Africa [*vax_cssa*], Central America [*vax_ctam*], East Asia [*vax_eaas*], East sub-Saharan Africa [*vax_essa*], North Africa and Middle East [*vax_name*], South East Asia, [*vax_seas*], South Asia [*vax_soas*], Southern sub-Saharan Africa [*vax_sssa*], Tropical South America [*vax_trsa*], and Western sub-Saharan Africa [*vax_wssa*].

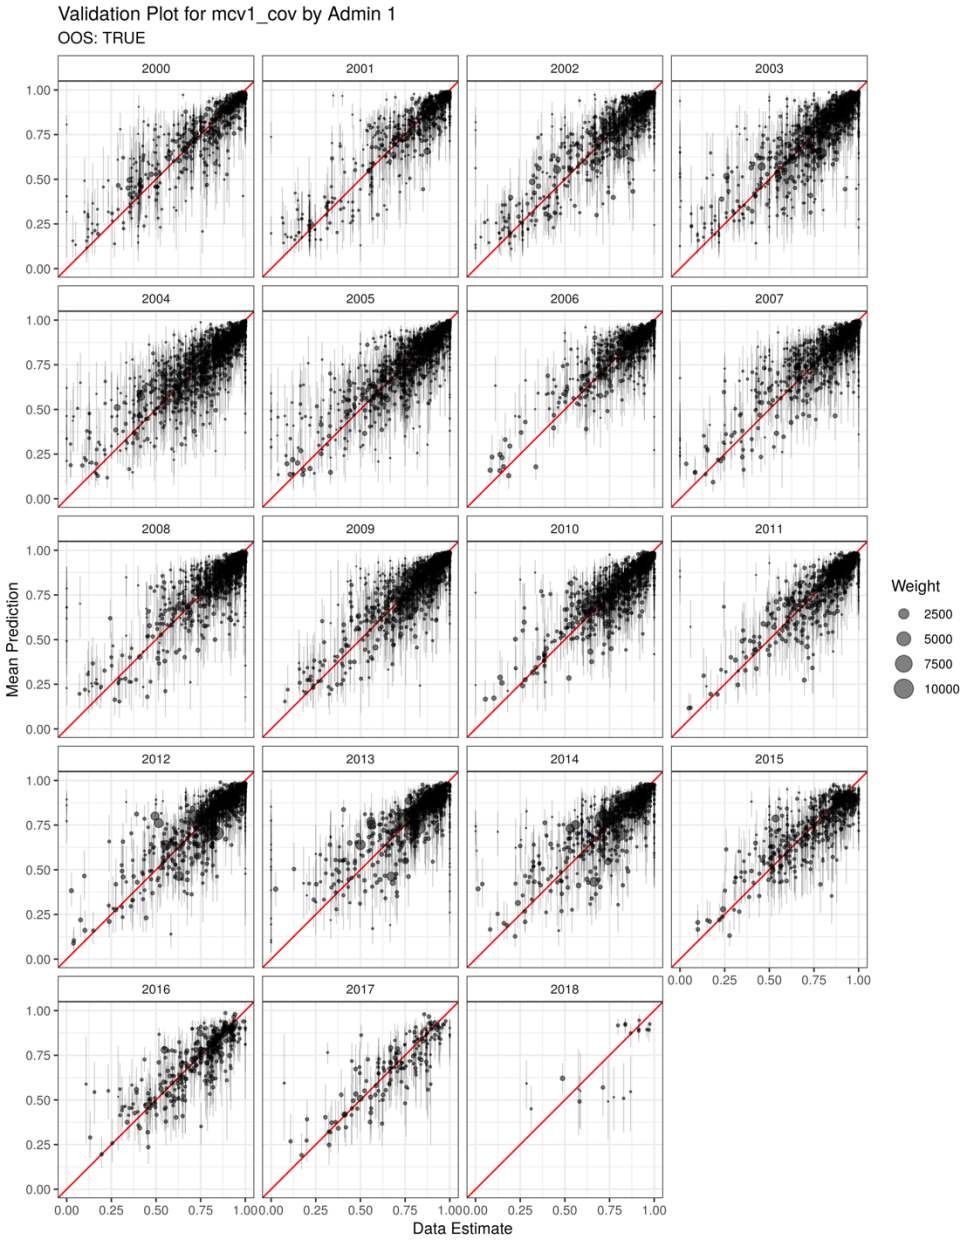


Supplementary Fig. 8: Second administrative level, in-sample validation plot, by year

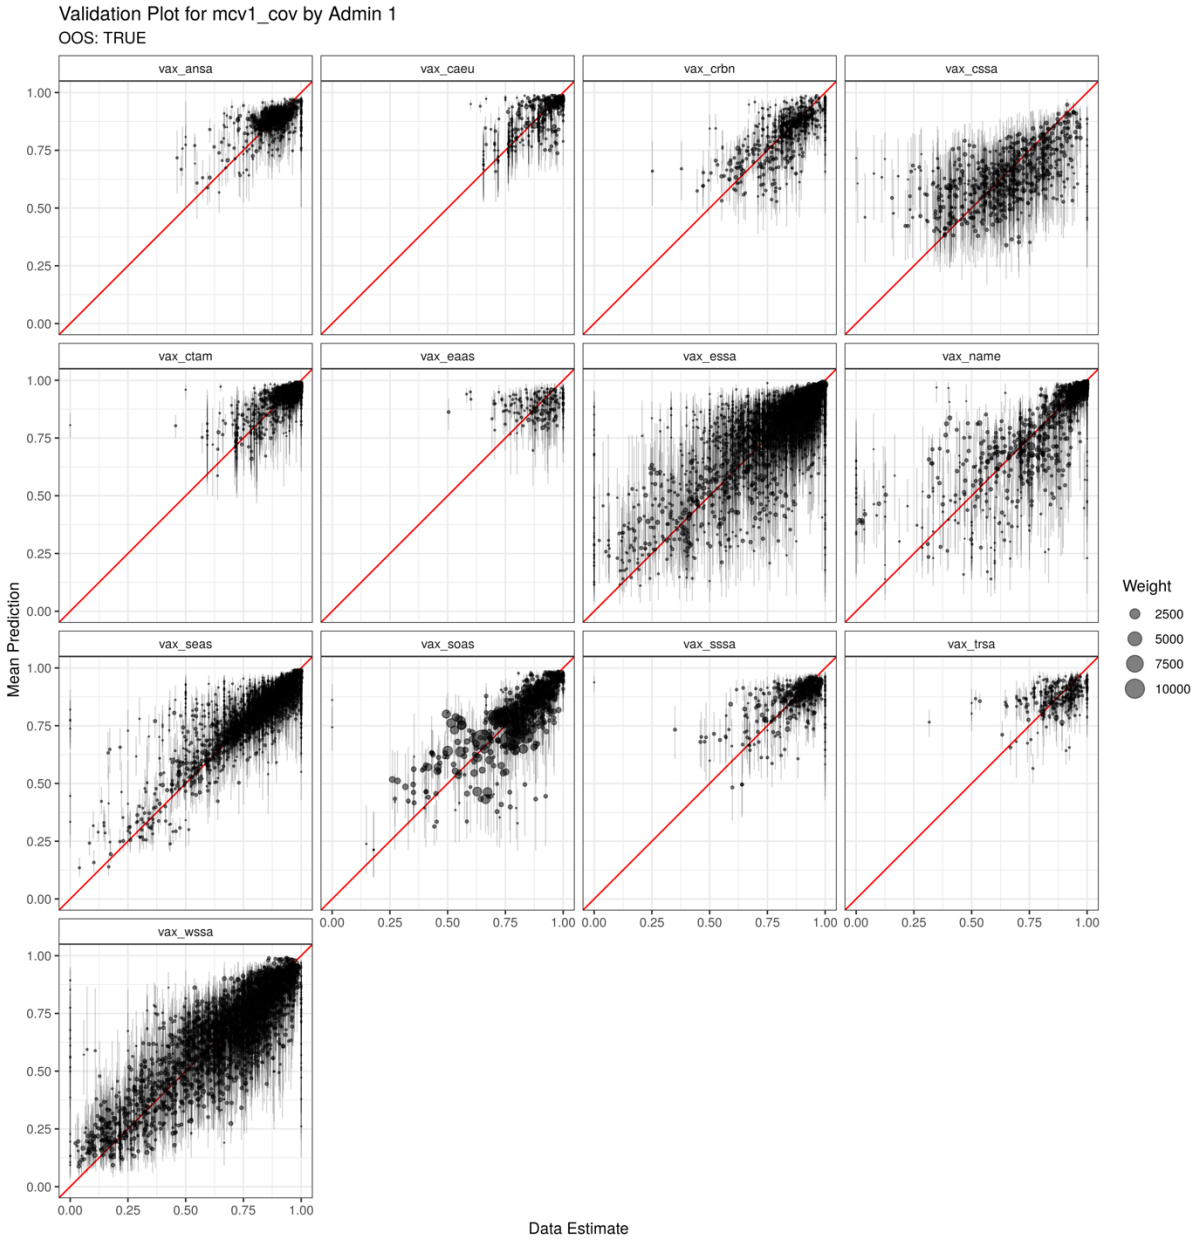


Supplementary Fig. 9: Second administrative level, in-sample validation plot, by region

Supplementary Figs 10–11: First administrative level out-of-sample validation plots
For each plot, the survey data and mean posterior prediction of coverage are compared. The size per dot is proportional to the sample size in the underlying data. Estimates are shown by region and year. Since there were only data through 2018, the years included only span through 2018. Regions are labelled as the following: Andean South America [*vax_ansa*], Central Asia Eastern Europe [*vax_caeu*], Caribbean [*vax_crbn]*, Central sub-Saharan Africa [*vax_cssa*], Central America [*vax_ctam*], East Asia [*vax_eaas*], East sub-Saharan Africa [*vax_essa*], North Africa and Middle East [*vax_name*], South East Asia, [*vax_seas*], South Asia [*vax_soas*], Southern sub-Saharan Africa [*vax_sssa*], Tropical South America [*vax_trsa*], and Western sub-Saharan Africa [*vax_wssa*].



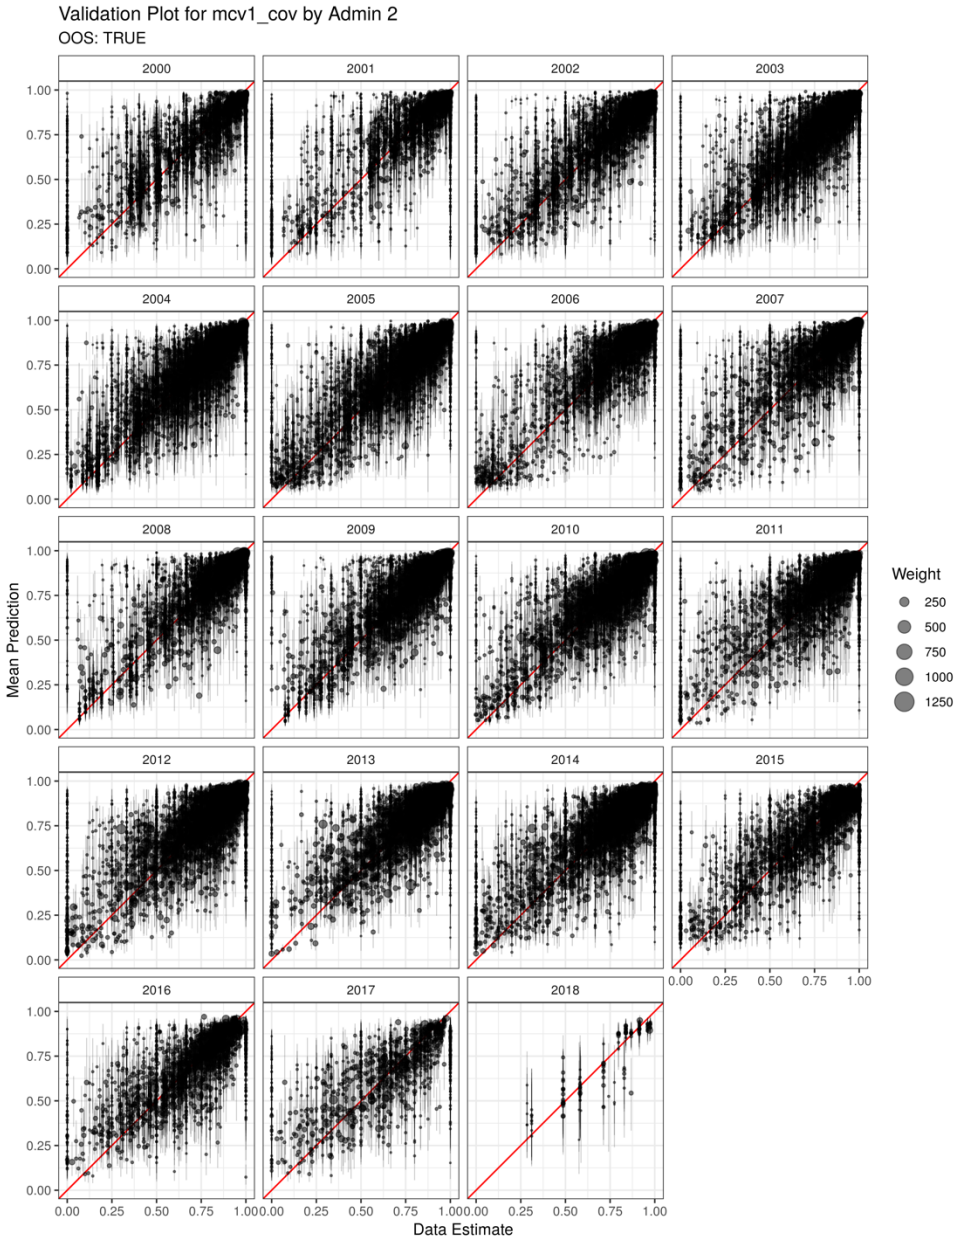
Supplementary Fig. 10: First administrative level, out-of-sample validation plot, by year



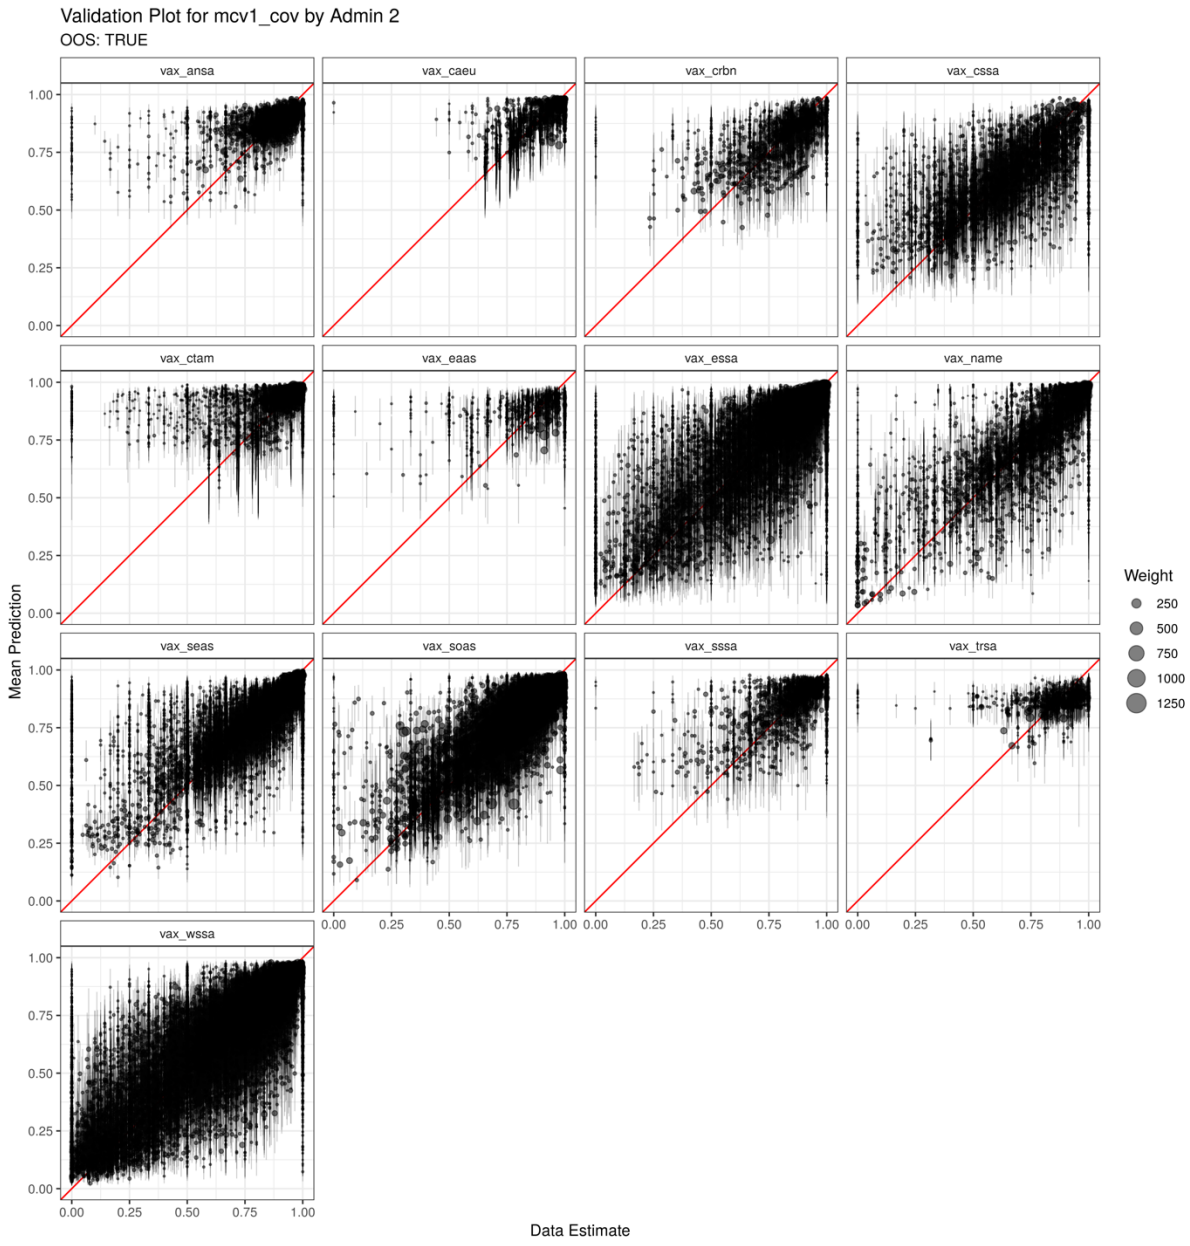
Supplementary Fig. 11: First administrative level, out-of-sample validation plot, by region

Supplementary Figs 12–13: Second administrative level out-of-sample validation plots

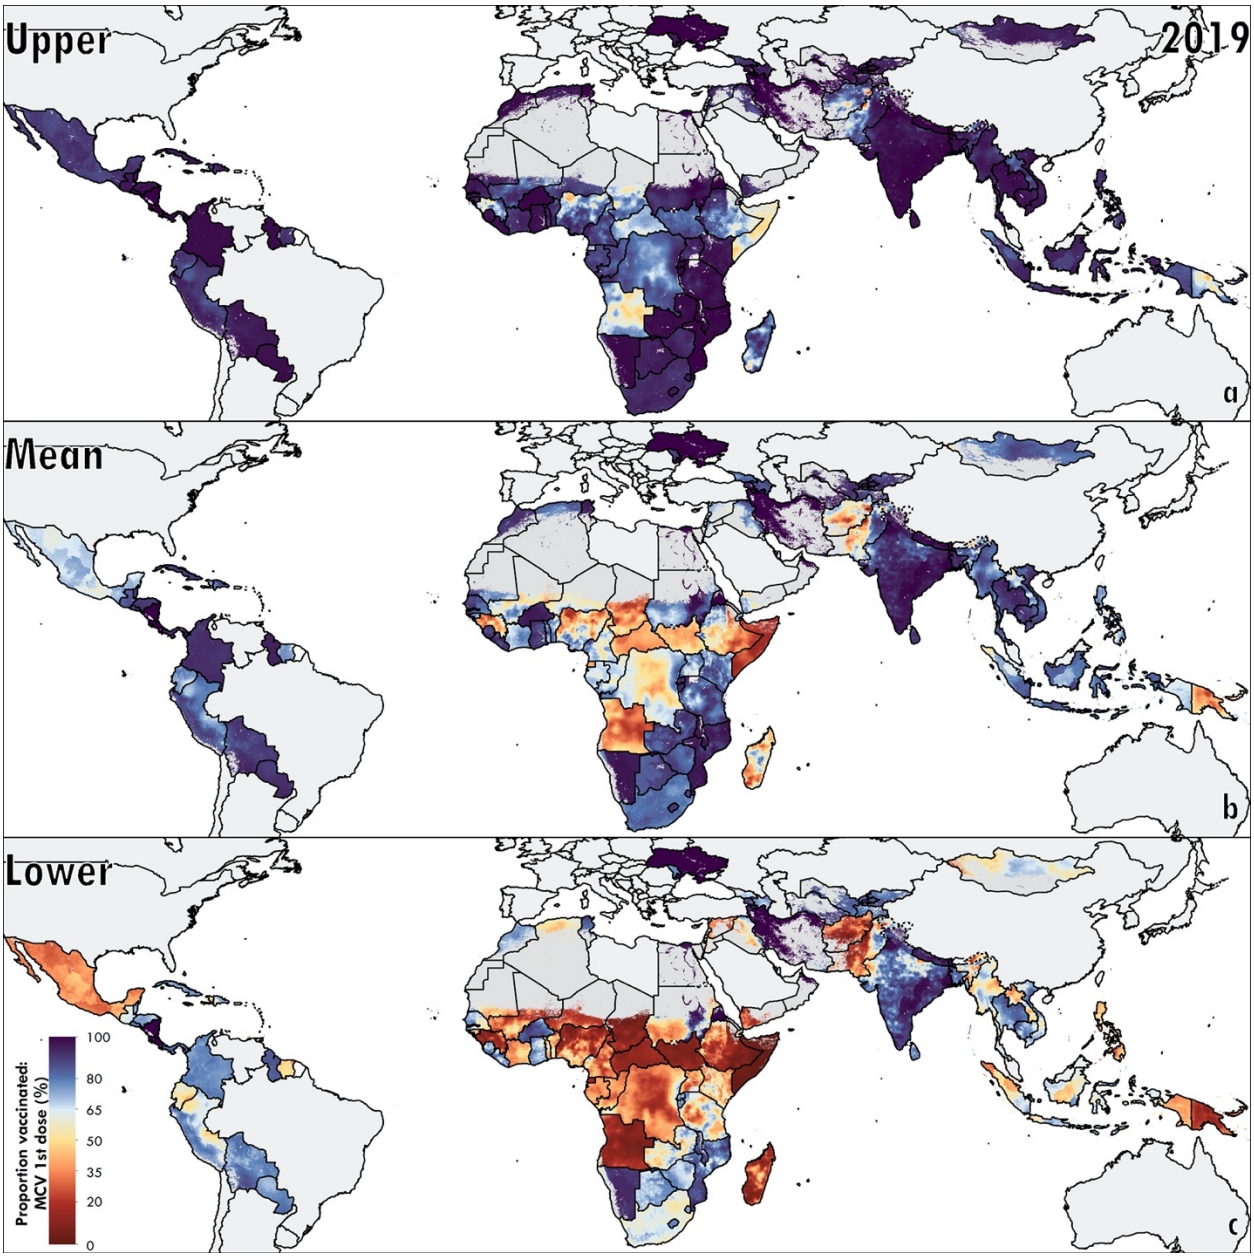
For each plot, the survey data and mean posterior prediction of coverage are compared. The size per dot is proportional to the sample size in the underlying data. Estimates are shown by region and year. Since there were only data through 2018, the years included only span through 2018. Regions are labelled as the following: Andean South America [*vax_ansa*], Central Asia Eastern Europe [*vax_caeu*], Caribbean [*vax_crbn]*, Central sub-Saharan Africa [*vax_cssa*], Central America [*vax_ctam*], East Asia [*vax_eaas*], East sub-Saharan Africa [*vax_essa*], North Africa and Middle East [*vax_name*], South East Asia, [*vax_seas*], South Asia [*vax_soas*], Southern sub-Saharan Africa [*vax_sssa*], Tropical South America [*vax_trsa*], and Western sub-Saharan Africa [*vax_wssa*].



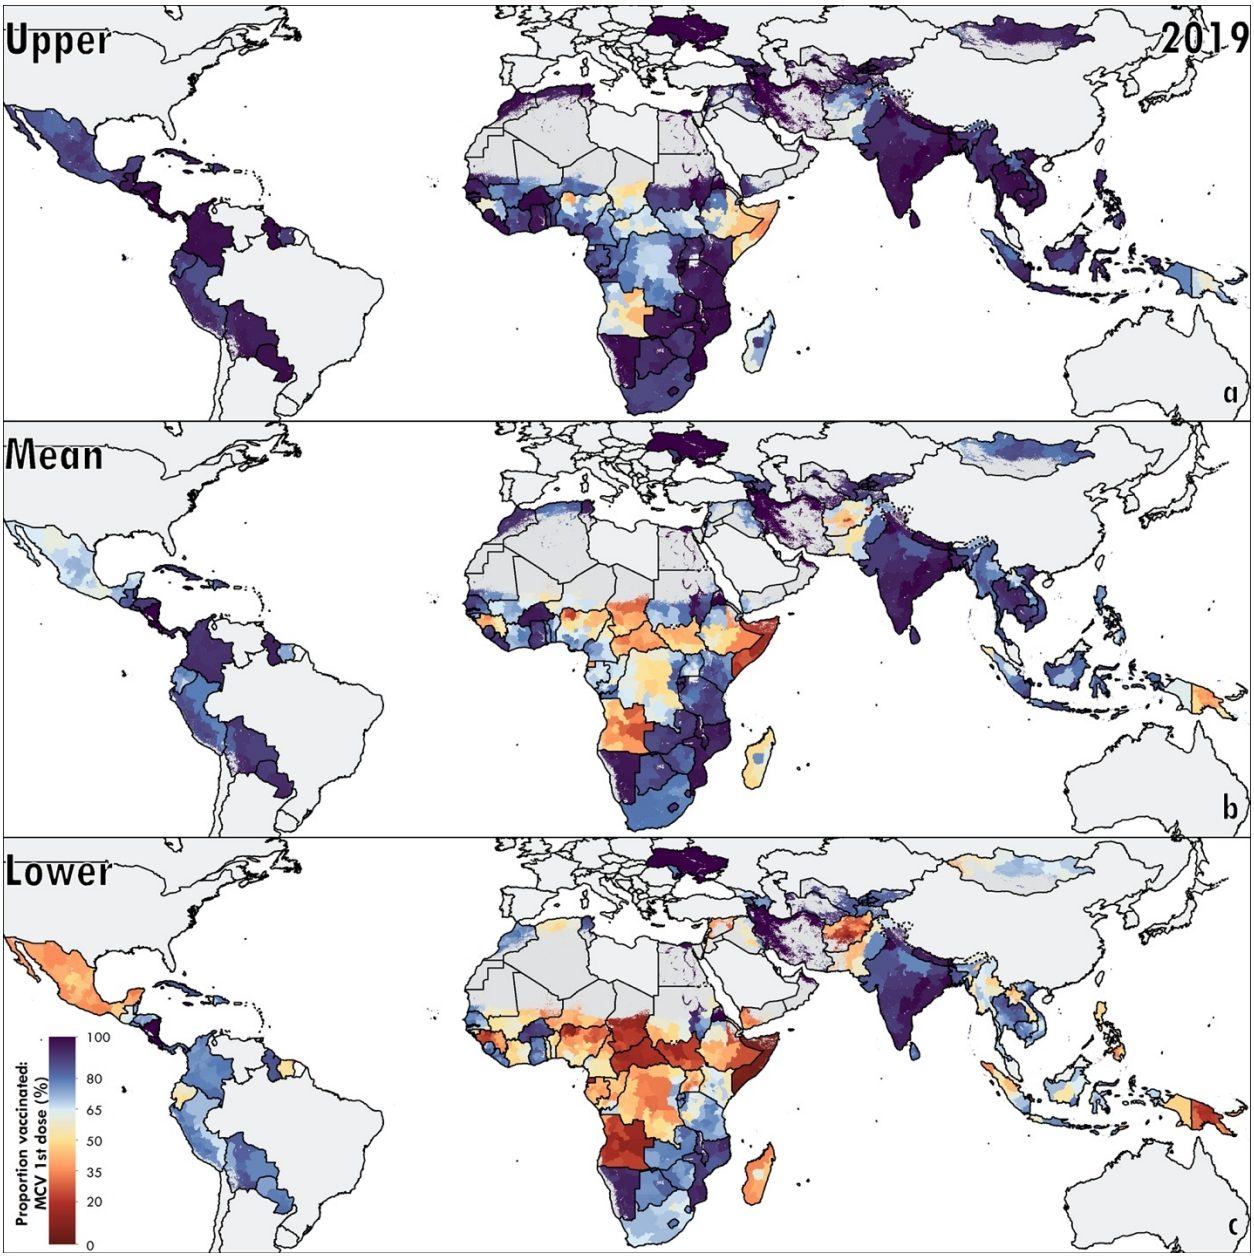
Supplementary Fig. 12: Second administrative level, out-of-sample validation plot, by year



Supplementary Fig. 13: Second administrative level, out-of-sample validation plot, by region

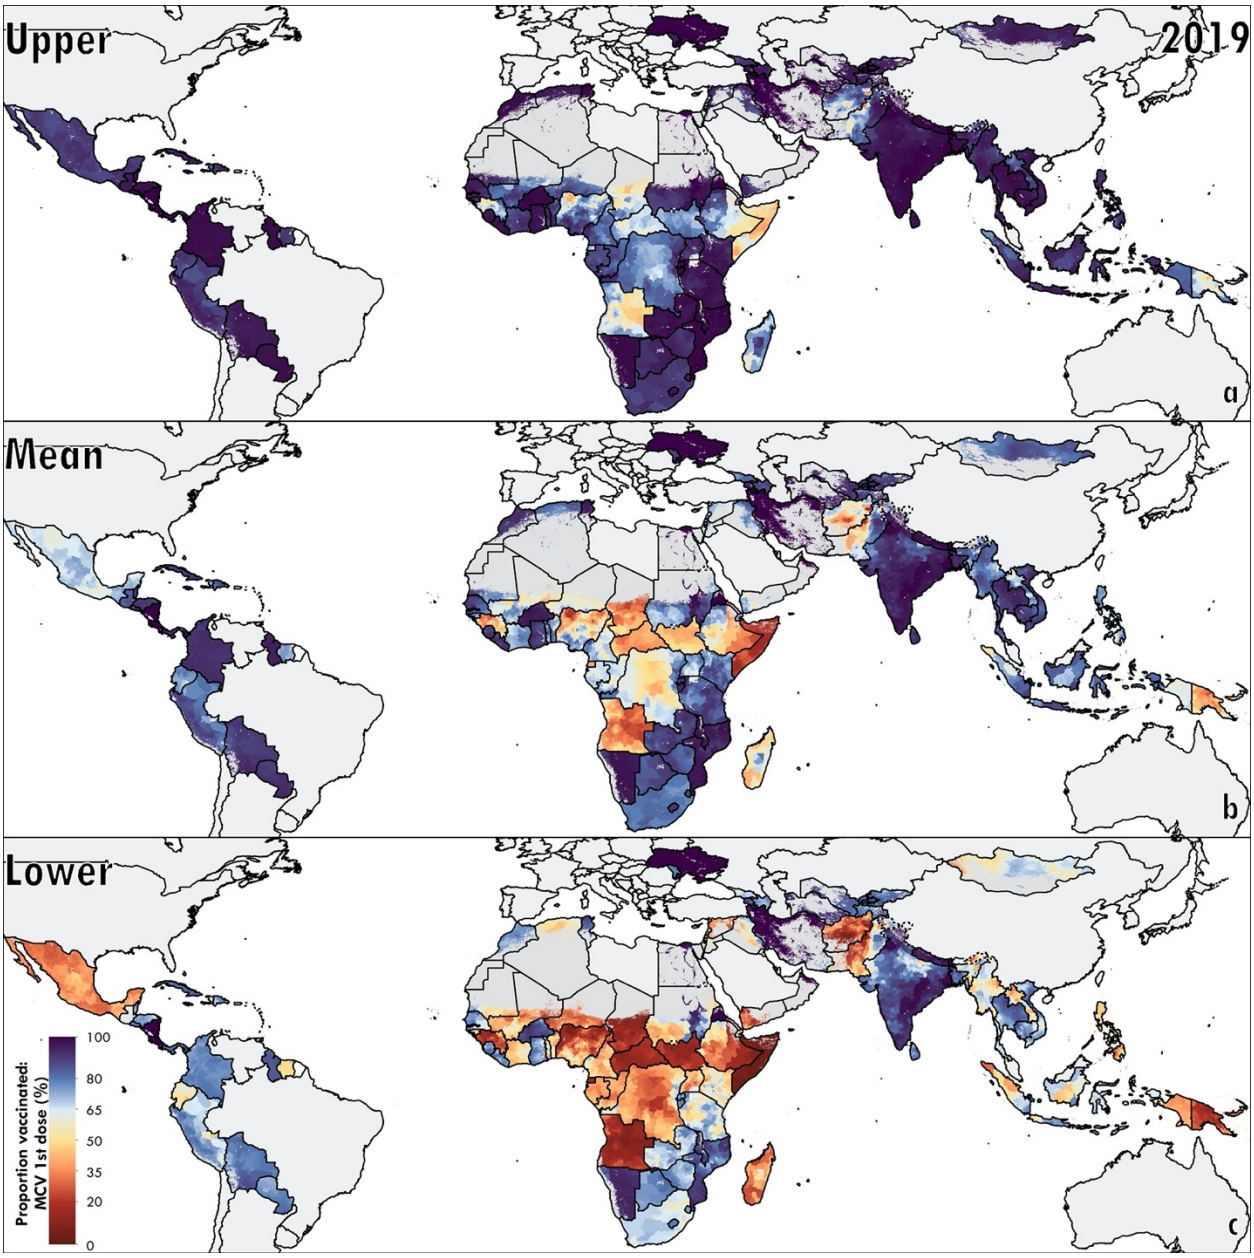


Supplementary Fig. 14: Pixel-level mean, lower, and upper uncertainty limits of MCV1 coverage, 2019 Posterior means and 95% uncertainty intervals are shown at the 5 × 5-km pixel level. Pixels that are grey in colour are either not included in the analysis, or have been classified by being "barren or sparsely vegetated" or had fewer than 10 people per 1 × 1-km pixel[15,26].



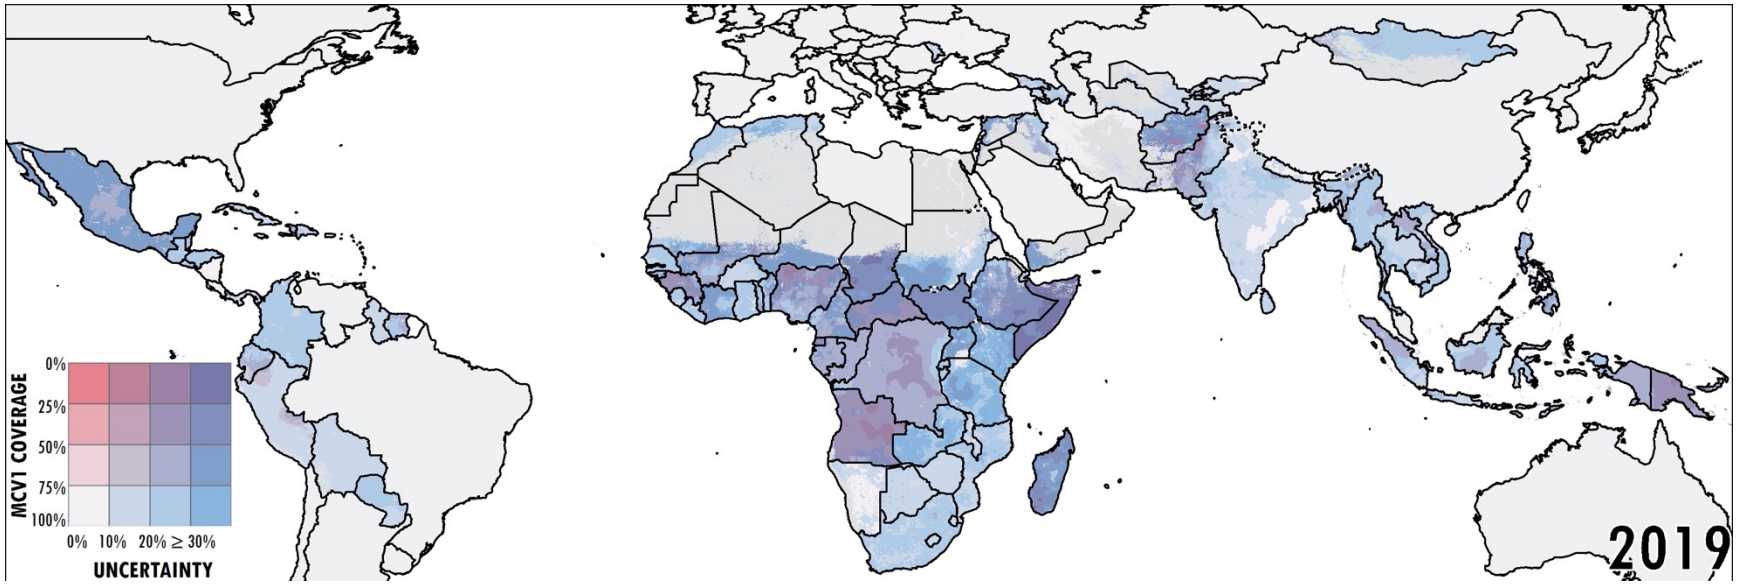
Supplementary Fig. 15: First administrative level mean, lower, and upper uncertainty limits of MCV1 coverage, 2019

Posterior means and 95% uncertainty intervals are shown at the first administrative level. Pixels that are grey in colour are either not included in the analysis, or have been classified by being "barren or sparsely vegetated" or had fewer than 10 people per 1 × 1-km pixel[15,26].

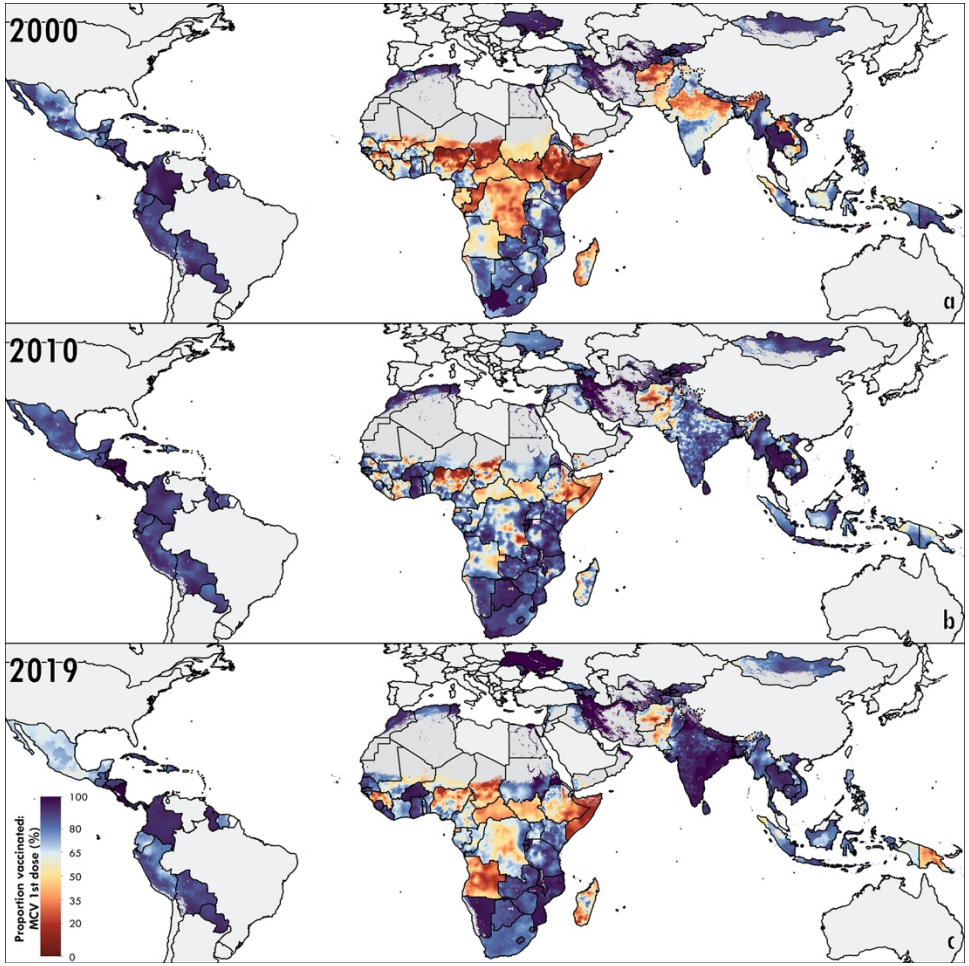


Supplementary Fig. 16: Second administrative level mean, lower, and upper uncertainty limits of MCV1 coverage, 2019

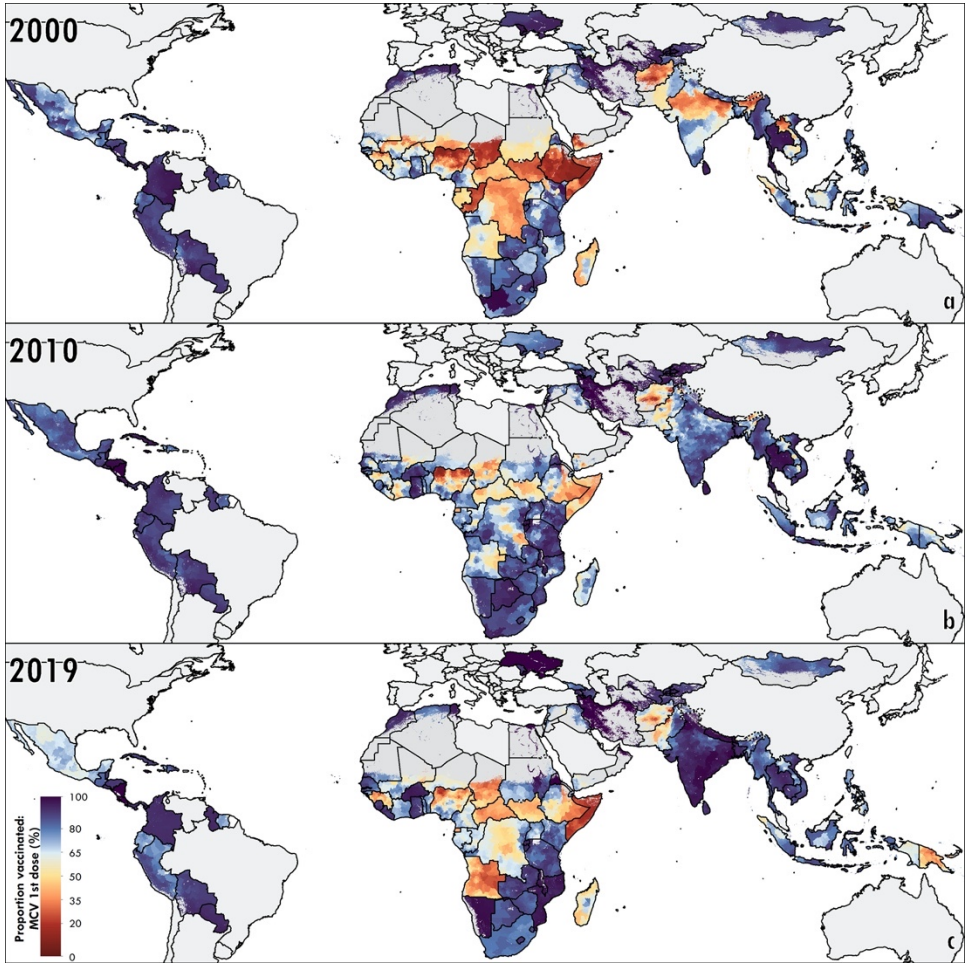
Posterior means and 95% uncertainty intervals are shown at the second administrative level. Pixels that are grey in colour are either not included in the analysis, or have been classified by being "barren or sparsely vegetated" or had fewer than 10 people per 1 × 1-km pixel[15,26].



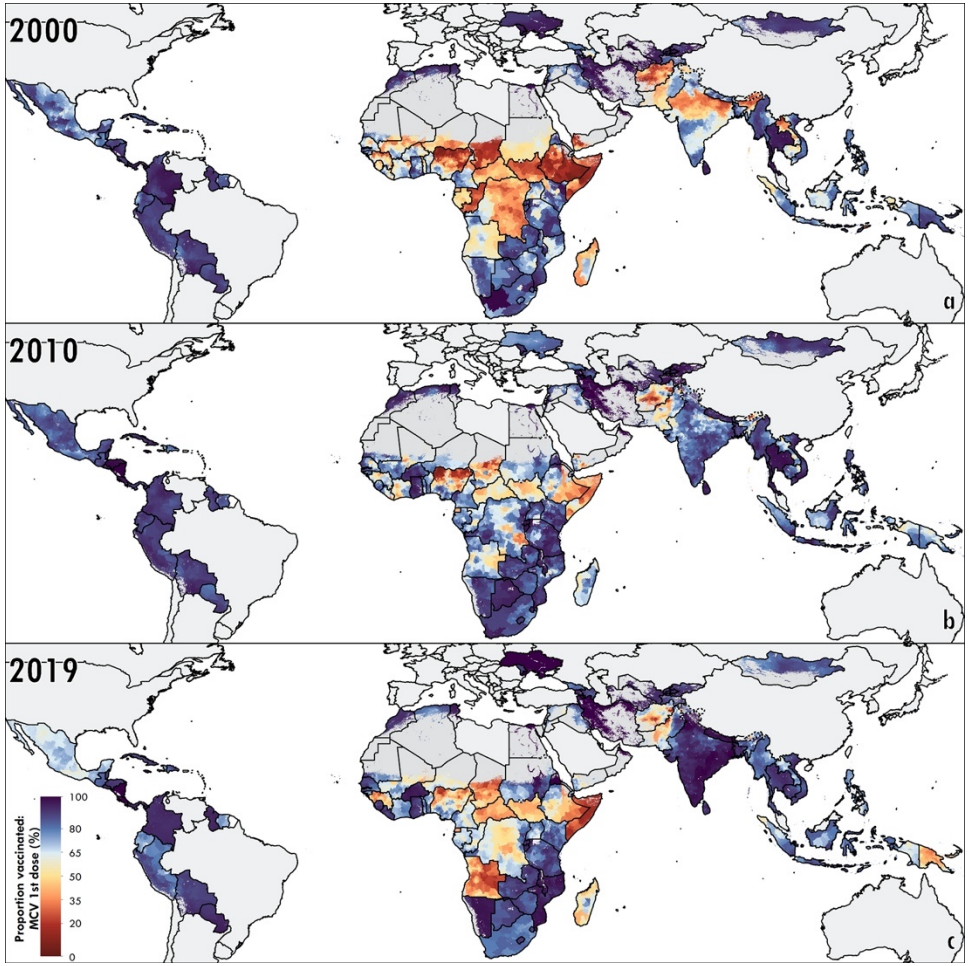
Supplementary Fig. 17: District level MCV1 coverage as function of uncertainty via Coffey-Feingold-Bromberg metric, 2019
Intensity of pink indicates areas that have lower uncertainty and lower coverage; intensity of blue indicates areas with higher coverage but also higher uncertainty. Purple indicates areas that have both low coverage and also higher uncertainty. Pixels that are grey in colour are either not included in the analysis, or have been classified by being "barren or sparsely vegetated" or had fewer than 10 people per 1 × 1-km pixel[15,26].



Supplementary Fig. 18: Estimated first-dose measles-containing vaccine (MCV1) coverage among districts in 101 low- and middle-income countries, 2000–2019, full age cohort model.
MCV1 coverage among target population in only the target age cohort in districts in 2000 (a), 2010 (b), and 2019 (c). Countries excluded from the analysis and pixels classified as 'barren or sparsely vegetated' based on European Space Agency Climate Change Initiative (ESA-CCI) satellite data or with fewer people than ten per 1 × 1-km pixel based on WorldPop estimates are masked in grey[15,26].



Supplementary Fig. 19: Estimated first-dose measles-containing vaccine (MCV1) coverage among districts in 101 low- and middle-income countries, 2000–2019, target age and t+1 cohort model.
MCV1 coverage among target population in only the target age and t+1 cohorts in districts in 2000 (a), 2010 (b), and 2019 (c). Countries excluded from the analysis and pixels classified as 'barren or sparsely vegetated' based on European Space Agency Climate Change Initiative (ESA-CCI) satellite data or with fewer people than ten per 1 × 1-km pixel based on WorldPop estimates are masked in grey[15,26].



Supplementary Fig. 20: Estimated first-dose measles-containing vaccine (MCV1) coverage among districts in 101 low- and middle-income countries, 2000–2019, target age cohort only model.
MCV1 coverage among target population in only the target age cohort only in districts in 2000 (a), 2010 (b), and 2019 (c). Countries excluded from the analysis and pixels classified as 'barren or sparsely vegetated' based on European Space Agency Climate Change Initiative (ESA-CCI) satellite data or with fewer people than ten per 1 × 1-km pixel based on WorldPop estimates are masked in grey[15,26].

4.0 Supplementary Tables

Supplementary Table 1: GATHER compliance checklist

Item number	Checklist item	Reported on page number(s):
Objectives and funding		
1	Define the indicator(s), populations (including age, sex, and geographic entities), and time period(s) for which estimates were made.	Methods (Overview); Supplementary Section 1.2
2	List the funding sources for the work.	Acknowledgements
Data inputs		
For all data inputs from multiple sources that are synthesised as part of the study:		
3	Describe how the data were identified and how the data were accessed.	Methods (Data); Supplementary Information 1.3
4	Specify the inclusion and exclusion criteria. Identify all ad hoc exclusions.	Methods (Data); Supplementary Information 1.3
5	Provide information on all included data sources and their main characteristics. For each data source used, report reference information or contact name/institution, population represented, data collection method, year(s) of data collection, sex and age range, diagnostic criteria or measurement method, and sample size, as relevant.	Supplementary Information 1.3; Supplementary Table 4
6	Identify and describe any categories of input data that have potentially important biases (e.g., based on characteristics listed in item 5).	Supplementary Table 4
For data inputs that contribute to the analysis but were not synthesised as part of the study:		
7	Describe and give sources for any other data inputs.	Supplementary Tables 6-7
For all data inputs:		
8	Provide all data inputs in a file format from which data can be efficiently extracted (e.g., a spreadsheet rather than a PDF), including all relevant meta-data listed in item 5. For any data inputs that cannot be shared because of ethical or legal reasons, such as third-party ownership, provide a contact name or the name of the institution that retains the right to the data.	Supplementary Table 4; http://ghdx.healthdata.org/lbd-publication-data-input-sources
Data analysis		
9	Provide a conceptual overview of the data analysis method. A diagram might be helpful.	Methods (Overview); Supplementary Information 1.4; Supplementary Fig. 1
10	Provide a detailed description of all steps of the analysis, including mathematical formulae. This description should cover, as relevant, data cleaning, data pre-processing, data adjustments and weighting of data sources, and mathematical or statistical model(s).	Methods (Geostatistcial model; Post-estimation; Model validation; Post hoc inequality analyses); Supplementary Information 1.3 – 1.4
11	Describe how candidate models were evaluated and how the final model(s) were selected.	Methods (Validation)

12	Provide the results of an evaluation of model performance, if done, as well as the results of any relevant sensitivity analysis.	Methods (Validation); Supplementary Figs. 6-13; Supplementary Tables 9-12
13	Describe methods for calculating uncertainty of the estimates. State which sources of uncertainty were, and were not, accounted for in the uncertainty analysis.	Methods (Post-estimation)
14	State how analytic or statistical source used to generate estimates can be accessed.	Data availability; Code availability
Results and discussion		
15	Provide published estimates in a file format from which data can be efficiently extracted.	Data availability
16	Report a quantitative measure of uncertainty of the estimates (e.g., uncertainty intervals).	Main text (Tracking uneven progress in routine MCV1 coverage); Supplementary Figs. 14-16, 17
17	Interpret results in light of existing evidence. If updating a previous set of estimates, describe the reasons for changes in estimates.	Discussion
18	Discuss limitations that affect interpretation of the estimates.	Methods (Limitations)

Supplementary Table 2: MCV1 vaccination schedule by country
Immunisation schedule for MCV1 per WHO record, for each country in analysis[27].

Country	Age

Supplementary Table 5: Survey sources excluded from analysis
Citations, series, country, and years provided for each excluded data set along with rationale for their exclusion. This table includes results of all LMICs from the GHDx, whether they were included in final analysis or not.

Country	Series	Year(s)	Citation	Rationale for exclusion
Albania	Albania Multiple Indicator Cluster Survey 2005	2005	National Institute of Statistics (Albania), United Nations Children's Fund (UNICEF). Albania Multiple Indicator Cluster Survey 2005. New York, United States: United Nations Children's Fund (UNICEF).	Estimates considered implausible. Survey estimates are systematically low compared to admin estimates and estimates from other established series (2004-2006 DHS)
Albania	Albania Demographic and Health Survey 2017-2018	2017-2018	Albania Institute of Public Health (IPH), Albania Institute of Statistics (INSTAT), ICF International. Albania Demographic and Health Survey 2017-2018. Fairfax, United States of America: ICF International, 2019.	Survey outliered due to absence of required survey variable indicators and reliability concerns.
Angola	Angola Core Welfare Indicators Questionnaire Survey 2011	2011	Ministry of Planning and Territorial Development (Angola), National Institute of Statistics (Angola). Angola Core Welfare Indicators Questionnaire Survey 2011. Luanda, Angola: National Institute of Statistics (Angola).	Estimates considered implausible. Survey estimates are systematically low compared to admin estimates
Armenia	Armenia Demographic and Health Survey 2005	2005	MOH Center for Health Information and Statistics, Macro International, Inc, National Statistical Service (NSS). Armenia Demographic and Health Survey 2005. Fairfax, United States of America: ICF International.	Outliered due to small sample size and reliability concerns. Estimates considered implausibly low compared to admin estimates
Bangladesh	Bangladesh - Dhaka Malnutrition and Enteric Disease Study 2009-2014	2009-2014	Fogarty International Center, National Institutes of Health (NIH), Foundation for the National Institutes of Health (FNIH), International Centre for Diarrhoeal Disease Research, Bangladesh (ICDDR,B). Bangladesh - Dhaka Malnutrition and Enteric Disease Study 2009-2014.	Survey estimates include implausibly high coverage rates of 100%
Bangladesh	Bangladesh GAVI FCE Measles-Rubella Post-Vaccine	2014	Institute for Health Metrics and Evaluation (IHME), International Centre for Diarrhoeal Disease Research, Bangladesh (ICDDR,B). Bangladesh GAVI FCE Measles-Rubella Post-	Post-campaign surveys make it difficult to distinguish routine immunization coverage from campaign coverage.

	Campaign Household Survey 2014		Vaccine Campaign Household Survey 2014. Seattle, United States of America: Institute for Health Metrics and Evaluation (IHME), 2017.	
Benin	Benin Demographic and Health Survey 2011-2012	2011-2012	ICF International, National Institute of Statistics and Economic Analysis (INSAE) (Benin), National Program Against AIDS (PNLS) (Benin). Benin Demographic and Health Survey 2011-2012. Fairfax, United States: ICF International, 2014.	Estimates considered implausible. Survey estimates are systematically low compared to admin estimates and estimates from other established survey series (2009-2012 Benin Health Statistical Yearbook, 2008 External Review of the Extended Programme on Immunisation)
Burkina Faso	Burkina Faso Core Welfare Indicators Questionnaire Survey 2005	2005	National Institute of Statistics and Demography (Burkina Faso), World Bank. Burkina Faso Core Welfare Indicators Questionnaire Survey 2005. Ouagadougou, Burkina Faso: National Institute of Statistics and Demography (Burkina Faso).	Estimates considered implausible. Survey estimates are inconsistent with admin estimates and estimates from other established survey series (Burkina Faso Multiple Indicator Cluster Survey 2006, Burkina Faso Demographic and Health Survey 2003)
Burkina Faso	Burkina Faso Core Welfare Indicators Questionnaire Survey 2007	2007	National Institute of Statistics and Demography (INSD). Burkina Faso Core Welfare Indicators Questionnaire Survey 2007. Ouagadougou, Burkina Faso: National Institute of Statistics and Demography (INSD), 2008.	Estimates considered implausible. Survey estimates are inconsistent with admin estimates and estimates from other established survey series (Burkina Faso Multiple Indicator Cluster Survey 2006, Burkina Faso Demographic and Health Survey 2003)
Cambodia	Cambodia Socio-Economic Survey 2009	2009	National Institute of Statistics (Cambodia), Statistics Sweden. Cambodia Socio-Economic Survey 2009. Phnom Penh, Cambodia: National Institute of Statistics (Cambodia).	Estimates considered implausible. Survey estimates are inconsistent with admin estimates and estimates from other established survey series (Cambodia Demographic and Health Survey 2005-2006, Cambodia Demographic and Health Survey 2010-2011)
Congo	Congo Demographic and Health Survey 2005	2005	Macro International, Inc, National Center for Statistics and Economic Studies (Congo, Rep.). Congo Demographic and Health Survey 2005. Fairfax, United States of America: ICF International.	Cohort years 2000-2003 removed due to implausible coverage rates.

Costa Rica	Costa Rica National Health Survey 2006	2006	Central American Population Center, University of Costa Rica. Costa Rica National Health Survey 2006. San José, Costa Rica: Central American Population Center, University of Costa Rica.	Estimates considered implausible. Survey estimates are systematically low compared to admin estimates and estimates from other established survey series (2007-2008 MICS)
Djibouti	Djibouti Family Health Survey 2002	2002	Department of Statistics and Demographic Studies (Djibouti), League of Arab States, Ministry of Health (Djibouti), Pan Arab Project for Family Health (PAPFAM). Djibouti Family Health Survey 2002.	Large difference in cohort coverage, with older cohorts having implausibly high coverage compare to younger cohorts.
Ecuador	Ecuador Reproductive Health Survey 2004	2004	Center for Studies of Population and Social Development (CEPAR) (Ecuador) and Division of Reproductive Health-Centers for Disease Control and Prevention (CDC). (2005) Ecuador Reproductive Health Survey 2004. Quito, Ecuador: CEPAR.	Estimates considered implausible. Survey reports an anomalous drop in coverage in 2004 that is inconsistent with admin estimates and estimates from other established survey series (2005-2006 Ecuador Living Conditions Survey)
El Salvador	El Salvador Reproductive Health Survey 2002-2003	2002-2003	Asociación demográfica salvadoreña (ADS), Division of Reproductive Health-Centers for Disease Control and Prevention (CDC). (2004) El Salvador Reproductive Health Survey 2002-2003. San Salvador, El Salvador: ADS.	Survey estimates include implausibly high coverage rates of 100%
El Salvador	El Salvador Reproductive Health Survey 2008	2008	Asociación demográfica salvadoreña (ADS), Division of Reproductive Health-Centers for Disease Control and Prevention (CDC). (2009) El Salvador Reproductive Health Survey 2008. San Salvador, El Salvador: ADS.	Estimates considered implausible. Survey estimates are systematically low compared to admin estimates and estimates from other established survey series (2012-2013 MICS)
Ethiopia	Ethiopia Welfare Monitoring Survey 2004	2004	Central Statistical Agency (Ethiopia). Ethiopia Welfare Monitoring Survey 2004.	Estimates considered implausible. Survey estimates are systematically high compared to admin estimates and estimates from other established surveys series (2001-2003 DHS, 2001 National EPI Coverage Survey)
Georgia	Georgia Multiple Indicator Cluster Survey 2005	2005	National Center for Disease Control (Georgia), State Department of Statistics of Georgia, United Nations Children's Fund (UNICEF). Georgia Multiple Indicator Cluster Survey 2005. New	Estimates considered implausible. Survey estimates are systematically low compared to admin estimates

			York, United States: United Nations Children's Fund (UNICEF).	
Ghana	Ghana Living Standards Measurement Survey 2012-2013	2012-2013	Ghana Statistical Service, World Bank. Ghana Living Standards Measurement Survey 2012-2013. Accra, Ghana: Ghana Statistical Service.	Estimates considered implausible. Survey estimates are systematically low compared to admin estimates
Guatemala	Guatemala Demographic and Health Survey 2014-2015	2014-2015	ICF International, Institute of Nutrition of Central America and Panama, Ministry of Public Health and Social Assistance (Guatemala), National Statistics Institute (Guatemala), Secretary of Planning and Programming of the Presidency (Segeplan) (Guatemala). Guatemala Demographic and Health Survey 2014-2015. Fairfax, United States: ICF International, 2017.	Estimates considered implausible. Survey estimates are systematically high compared to admin estimates and trends from other established surveys in nearby years (2008-2009 Guatemala Reproductive Health Survey)
Honduras	Honduras Survey of Living Conditions 2004	2004	National Institute of Statistics (Honduras). Honduras Survey of Living Conditions 2004. Tegucigalpa, Honduras: National Institute of Statistics (Honduras).	Survey estimates include implausibly high coverage rates of 100%
India	India District Level Household Survey 2007-2008	2007-2008	International Institute for Population Sciences (India). India District Level Household Survey 2007-2008. Mumbai, India: International Institute for Population Sciences (India), 2010.	Estimates considered implausible. Survey estimates are systematically high compared to admin estimates and estimates from other established survey series (2003-2004 DHS, 2004-2005 India Human Development Survey, 2005 India Coverage Evaluation Survey)
India	India - Vellore Malnutrition and Enteric Disease Study 2009-2014	2009-2014	Fogarty International Center, National Institutes of Health (NIH), Foundation for the National Institutes of Health (FNIH). India - Vellore Malnutrition and Enteric Disease Study 2009-2014.	2010 estimates considered implausibly low compared to other survey years.
India	India District Level Household	2012-2014	International Institute for Population Sciences (India). India District Level Household Survey 2012-2014. New Delhi, India: Ministry of Health and Family Welfare (India).	Estimates considered implausible. Coverage estimates are greater than 12% higher than coverage reported by India Demographic and

	Survey 2012-2014			Health Survey 2015-2016 for the same cohort years.
Indonesia	Indonesia Family Life Survey 2000	2000	Center for Population and Policy Studies, Gadjah Mada University (Indonesia), RAND Corporation. Indonesia Family Life Survey 2000. Santa Monica, United States: RAND Corporation.	Estimates considered implausible. Survey estimates are systematically high compared to admin estimates and estimates from other established survey series (1996-1999 DHS)
Indonesia	Indonesia National Socioeconomic Survey 2006	2004-2013	Statistics Indonesia. Indonesia National Socioeconomic Survey 2006.	Estimates considered implausible. Survey estimates are inconsistent with admin estimates and estimates from other established survey series (2007-2008 Indonesia Family Life Survey, 2003-2005 DHS)
Indonesia	Indonesia Family Life Survey East 2012	2012	National Team for the Acceleration of Poverty Reduction (TNP2K) (Indonesia), SurveyMETER, University of Southern California, World Bank. Indonesia Family Life Survey East 2012.	Estimates considered implausible. Survey estimates are inconsistent with admin estimates and estimates from other established survey series (2008-2011 DHS)
Kenya	Kenya - North Eastern Province Multiple Indicator Cluster Survey 2007	2007	Kenya National Bureau of Statistics, United Nations Children's Fund (UNICEF). Kenya - North Eastern Province Multiple Indicator Cluster Survey 2007. Nairobi, Kenya: Kenya National Bureau of Statistics.	Estimates considered implausible. Survey estimates are systematically low compared to admin estimates and estimates from other established survey series (2005-2006 Kenya Integrated Household Budget Survey, 2004-2006 DHS)
Kyrgyzstan	Kyrgyzstan Multiple Indicator Cluster Survey 2014	2014	National Statistical Committee of the Kyrgyz Republic, United Nations Children's Fund (UNICEF). Kyrgyzstan Multiple Indicator Cluster Survey 2014. New York, United States of America: United Nations Children's Fund (UNICEF), 2015.	Implausibly low coverage estimates of 0% for some age cohorts.
Lebanon	Lebanon Family Health Survey 2004	2004	Central Administration of Statistics (Lebanon), League of Arab States, Ministry of Social Affairs (Lebanon), Pan Arab Project for Family Health (PAPFAM). Lebanon Family Health Survey 2004.	Data was only collected at national level

Lebanon	Palestinians in Lebanon Multiple Indicator Cluster Survey 2005-2006	2005-2006	Palestinian Central Bureau of Statistics, Pan Arab Project for Family Health (PAPFAM), United Nations Children's Fund (UNICEF). Palestinians in Lebanon Multiple Indicator Cluster Survey 2005-2006. New York, United States: United Nations Children's Fund (UNICEF).	Estimates considered implausible. Survey estimates are inconsistent with both admin estimates and estimates from other established survey series (2006-2007 Palestine Family Health Survey)
Lebanon	Palestinians in Lebanon Multiple Indicator Cluster Survey 2011	2011	Palestinian Central Bureau of Statistics, United Nations Children's Fund (UNICEF). Palestinians in Lebanon Multiple Indicator Cluster Survey 2011. New York, United States: United Nations Children's Fund (UNICEF), 2013.	Estimates considered implausible. Survey estimates are inconsistent with both admin estimates and estimates from other established survey series (2004 Lebanon Family Health Survey)
Moldova	Moldova Multiple Indicator Cluster Survey 2000	2000	National Scientific and Applied Center for Preventive Medicine (NCPM) (Moldova), United Nations Children's Fund (UNICEF). Moldova Multiple Indicator Cluster Survey 2000. New York, United States: United Nations Children's Fund (UNICEF).	Estimates considered implausible. Survey estimates are systematically high compared to admin estimates and estimates from other established survey series (2002-2004 DHS)
Mali	Mali Multiple Indicator Cluster Survey 2009-2010	2009-2010	Ministry of Health (Mali), National Institute of Statistics (INSTAT) (Mali), United Nations Children's Fund (UNICEF). Mali Multiple Indicator Cluster Survey 2009-2010. New York, United States: United Nations Children's Fund (UNICEF), 2017.	Estimates considered implausible. Survey estimates are inconsistent with both admin estimates and estimates from other established survey series (2008-2011 DHS, 2010-2013 World Bank Living Standards Measurement Survey)
Mexico	Mexico Family Life Survey 2005-2006	2005-2006	California Center for Population Research (CCPR), University of California Los Angeles (UCLA), Center for Research and Teaching in Economics (CIDE) (Mexico), Ibero-American University, National Institute of Public Health (Mexico). Mexico Family Life Survey 2005-2006.	Estimates considered implausible. Survey estimates are inconsistent with both admin estimates and estimates from other established survey series (2008-2009 Mexican National Health and Nutrition Survey)
Mexico	Mexico Family Life Survey 2008-2013	2008-2013	Center for Research and Teaching in Economics (CIDE) (Mexico), Duke University, Ibero-American University, National Institute of Public Health (Mexico), University of	Estimates considered implausible. Sudden drop in coverage inconsistent with admin estimates and estimates from other established survey series (Mexico National Survey of Health and Nutrition

			California, Los Angeles (UCLA). Mexico Family Life Survey 2008-2013.	2011-2012, Mexico Multiple Indicator Cluster Survey 2015)
Mongolia	Mongolia Multiple Indicator Cluster Survey 2013	2013	Government of Mongolia, National Statistical Office of Mongolia, United Nations Children's Fund (UNICEF), United Nations Population Fund (UNFPA). Mongolia Multiple Indicator Cluster Survey 2013. New York, United States: United Nations Children's Fund (UNICEF), 2016.	Estimates considered implausible. Sudden drop in coverage inconsistent with admin estimates and MICS estimates from neighboring years
Morocco	Morocco National Survey on Population and Family Health 2010-2011	2010-2011	Ministry of Health (Morocco), Pan Arab Project for Family Health (PAPFAM), United Nations Children's Fund (UNICEF), United Nations Population Fund (UNFPA), World Health Organization (WHO). Morocco National Survey on Population and Family Health 2010-2011.	Estimates for cohort year 2008 removed due to 100% coverage. Other cohort years retained
Nepal	Nepal Living Standards Measurement Survey 2003-2004	2009-2014	Fogarty International Center, National Institutes of Health (NIH), Foundation for the National Institutes of Health (FNIH), Institute of Medicine, Tribhuvan University, University of Bergen, Walter Reed/AFRIMS Research Unit Nepal (WARUN). Nepal - Bhaktapur Malnutrition and Enteric Disease Study 2009-2014.	Estimates considered implausible. Survey estimates include implausibly high coverage rates of 100%
Nepal	Nepal - Bhaktapur Malnutrition and Enteric Disease Study 2009-2014	2014-2015	National Institute of Statistics (Niger), World Bank. Niger National Survey on Household Living Conditions and Agriculture 2014-2015. Washington DC, United States of America: World Bank.	Estimates considered implausible. Survey estimates include implausibly high coverage rates of 100%
Niger	Niger National Survey on Household Living Conditions and Agriculture 2014-2015	2014-2015	National Institute of Statistics (Niger), World Bank. Niger National Survey on Household Living Conditions and Agriculture 2014-2015. Washington DC, United States of America: World Bank.	Estimates outliered due to reliability concerns, survey design, and implausibly low coverage.

Nigeria	Nigeria Reproductive Health, Child Health, and Education Household, School, and Health Facility Baseline Surveys 2005	2005	MEASURE Evaluation Project, Carolina Population Center, University of North Carolina, Center for Research, Evaluation, and Resource Development (CRERD), Center for Communication Programs, Bloomberg School of Public Health, Johns Hopkins, Creative Associates International, Constella Futures, Adolescent Health and Information Project (Nigeria), Federation of Muslim Women's Associations of Nigeria (FOMWAN), Nigerian Medical Association, Management Sciences for Health (MSH), Civil Society Action Coalition on Education For All. Nigeria Reproductive Health, Child Health, and Education Household, School, and Health Facility Baseline Surveys 2005. Chapel Hill, United States: MEASURE Evaluation Project, Carolina Population Center, University of North Carolina.	Estimates considered implausible. Survey estimates are inconsistent with both admin estimates and estimates from other established survey series (1999-2007 DHS, 2007-2010 MICS)
Nigeria	Nigeria General Household Survey 2007	2007	Central Bank of Nigeria, National Bureau of Statistics (Nigeria), Nigerian Communications Commission (NCC). Nigeria General Household Survey 2007. Abuja, Nigeria: National Bureau of Statistics (Nigeria).	Estimates considered implausible. Survey estimates are systematically low compared to admin estimates and estimates from other established survey series (1999-2007 DHS, 2007-2010 MICS)
Nigeria	Nigeria Reproductive Health, Child Health, and Education Household, School, and Health Facility Midline Surveys 2007	2007	MEASURE Evaluation Project, Carolina Population Center, University of North Carolina, Center for Research, Evaluation, and Resource Development (CRERD), Center for Communication Programs, Bloomberg School of Public Health, Johns Hopkins, Creative Associates International, Constella Futures, Adolescent Health and Information Project (Nigeria), Federation of Muslim Women's Associations of Nigeria (FOMWAN), Nigerian Medical Association, Management Sciences for Health (MSH), Civil Society Action Coalition on Education For All. Nigeria Reproductive Health,	Estimates considered implausible. Survey estimates are inconsistent with both admin estimates and estimates from other established survey series (1999-2007 DHS, 2007-2010 MICS)

			Child Health, and Education Household, School, and Health Facility Midline Surveys 2007. Chapel Hill, United States: MEASURE Evaluation Project, Carolina Population Center, University of North Carolina.	
Nigeria	Nigeria Living Standards Survey 2008-2010	2008-2010	National Bureau of Statistics (Nigeria). Nigeria Living Standards Survey 2008-2010. Abuja, Nigeria: National Bureau of Statistics (Nigeria).	Estimates considered implausible. Survey estimates are systematically high compared to admin estimates and estimates from other established survey series (1999-2007 DHS, 2007-2010 MICS)
Nigeria	Nigeria General Household Survey 2010-2011	2010-2011	National Bureau of Statistics (Nigeria). Nigeria General Household Survey 2010-2011. Abuja, Nigeria: National Bureau of Statistics (Nigeria).	Estimates considered implausible. Survey estimates are systematically high compared to admin estimates and estimates from other established survey series (2009 DHS, 2009 MICS, 2009 Nigeria Reproductive Health, Child Health, and Education Household, School, and Health Facility Survey, 2009-2012 Nigeria Annual Abstract of Statistics)
Nigeria	Nigeria General Household Survey 2012-2013	2012-2013	National Bureau of Statistics (Nigeria). Nigeria General Household Survey 2012-2013. Washington DC, United States: World Bank.	Estimates considered implausible. Survey estimates are systematically low compared to admin estimates and estimates from other established survey series (2011 DHS)
Nigeria	Nigeria Multiple Indicator Cluster Survey with National Immunization Coverage Survey Supplement 2016-2017	2016-2017	National Agency for the Control of AIDS (Nigeria), National Bureau of Statistics (Nigeria), National Primary Health Care Development Agency (NPHCDA) (Nigeria), United Nations Children's Fund (UNICEF). Nigeria Multiple Indicator Cluster Survey with National Immunization Coverage Survey Supplement 2016-2017. New York, United States: United Nations Children's Fund (UNICEF), 2018.	Estimates considered implausible. Survey estimates are systematically high compared to admin estimates and estimates from other established survey series (1999-2007 DHS)
Pakistan	Pakistan Social and Living Standards Measurement	2014-2015	Pakistan Bureau of Statistics. Pakistan Social and Living Standards Measurement Survey 2014-2015. Islamabad, Pakistan: Pakistan Bureau of Statistics, 2016.	Estimates considered implausible. Survey estimates are inconsistent with admin estimates and estimates from other established survey series

	Survey 2014-2015			(2010-2011 DHS, 2011 Pakistan National Nutrition Survey)
Peru	Peru Continuous Demographic and Health Survey 2003-2008	2003-2008	Ministry of Economy and Finance (Peru), National Institute of Statistics and Informatics (Peru), ORC Macro. Peru Continuous Demographic and Health Survey 2003-2008. Fairfax, United States of America: ICF International.	Survey outliered due to absence of required survey variable indicators.
Peru	Peru - Loreto Malnutrition and Enteric Disease Study 2009-2014	2009-2014	Fogarty International Center, National Institutes of Health (NIH), Foundation for the National Institutes of Health (FNIH), Johns Hopkins Bloomberg School of Public Health. Peru - Loreto Malnutrition and Enteric Disease Study 2009-2014.	Estimates considered implausible. Survey estimates include implausibly high coverage rates of 100%
Qatar	Qatar Multiple Indicator Cluster Survey 2012	2012	Ministry of Development Planning and Statistics (Qatar), Qatar Foundation for Education, Science and Community Development, Qatar Statistics Authority, Supreme Council of Health (Qatar), United Nations Children's Fund (UNICEF). Qatar Multiple Indicator Cluster Survey 2012. New York, United States: United Nations Children's Fund (UNICEF), 2018.	Estimates considered implausible. Survey estimates are systematically low
Sierra Leone	Sierra Leone Multiple Indicator Cluster Survey 2010	2010	Statistics Sierra Leone, United Nations Children's Fund (UNICEF). Sierra Leone Multiple Indicator Cluster Survey 2010. New York, United States: United Nations Children's Fund (UNICEF).	Estimates considered implausible. Survey estimates are systematically high compared to admin estimates and estimates from other established surveys over the same period (2006-2009 DHS)
Uganda	Uganda National Service Delivery Survey 2004	2004	Ministry of Public Service (Uganda), Uganda Bureau of Statistics. Uganda National Service Delivery Survey 2004. OpenMicroData.	Estimates considered implausible. Survey estimates are systematically high compared to estimates from other established surveys over the same period (Uganda Demographic and Health Survey 2000-2001, Uganda Demographic and Health Survey 2011). Also, some households were not covered due to insecurity in the districts of Gulu, Lira, Katakwi, Kitgum, and Pader; while in Karamoja region (Kotido, Nakapiripirit and

				Moroto) due to mobility of the pastoralist communities.
Uganda	Uganda Gavi FCE Household Survey 2015	2015	Institute for Health Metrics and Evaluation (IHME), Infectious Diseases Research Collaboration (IDRC). Uganda Gavi FCE Household Survey 2015. Seattle, United States: Institute for Health Metrics and Evaluation (IHME), 2017.	Estimates considered implausible. Survey estimates are inconsistent with admin estimates and estimates from other established survey series (Uganda Living Standards Measurement Survey - Integrated Survey on Agriculture 2013-2014, Uganda Demographic and Health Survey 2016)
Yemen	Yemen - Dhamar Nutritional Status and Mortality Survey 2013	2013	Ministry of Public Health and Population (Yemen), Yemen UNICEF. Yemen - Dhamar Nutritional Status and Mortality Survey 2013.	Estimates considered implausible. Survey estimates include implausibly high coverage rates of 100%

Supplementary Table 7: Covariates used per region in stacked generalisation ensemble modelling after variance inflation factor algorithm for covariate selection
Regions are defined as the following: Andean South America [*ANSA*], Central Asia Eastern Europe [*CAEU*], Caribbean [*CRBN]*, Central sub-Saharan Africa [*CSSA*], Central America [*CTAM*], East Asia [*EAAS*], East sub-Saharan Africa [*ESSA*], North Africa and Middle East [*NAME*], South East Asia, [*SEAS*], South Asia [*SOAS*], Southern sub-Saharan Africa [*SSSA*], Tropical South America [*TRSA*], and Western sub-Saharan Africa [*WSSA*]. A "Yes" indicates the covariate was selected per region and a "No" indicates the covariate was not selected.

Covariate	ANSA	CAEU	CRBN	CSSA	CTAM	EAAS	ESSA	NAME	SEAS	SOAS	SSSA	TRSA	WSSA
Access to roads	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Distance from rivers or lakes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Elevation	No	No	Yes	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Population	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Urban or rural	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Irrigation	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Cloud cover percentage	Yes	Yes	Yes	Yes	Yes	No	Yes	Yes	Yes	No	Yes	No	Yes
Mean diurnal temperature range	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
Frost day frequency	Yes	No	Yes	Yes	Yes	No	Yes	No	Yes	Yes	No	Yes	Yes
Mean potential evapotranspiration per day per month	Yes	No	Yes	No	No	Yes	Yes	No	Yes	Yes	Yes	Yes	No
Average daily minimum temperature	No	No	No	No	No	No	No	No	No	No	No	No	Yes
Average daily mean temperature	No	No	No	No	No	No	No	No	No	No	No	No	No
Average daily maximum temperature	No	No	No	Yes	Yes	No	No	No	Yes	No	No	Yes	No
Mean vapour pressure	No	Yes	Yes	No	No	No	No	Yes	No	No	No	No	No

Monthly wet day frequency	Yes	Yes	Yes	Yes	No	Yes	Yes	No	Yes	Yes	Yes	No	No
Enhanced vegetation index	No	No	No	No	No	No	No	No	Yes	Yes	No	Yes	No
Growing season length	No	Yes	Yes	No	No	No	No	Yes	Yes	No	Yes	Yes	No
Normalised difference vegetation index	Yes	Yes	Yes	Yes	Yes	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Multi-source Weighted-Ensemble Precipitation	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Tasseled cap brightness	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	Yes
Tasseled cap wetness	Yes	Yes	No	No	Yes	Yes	No	No	No	Yes	Yes	No	No
Daytime land surface temperature	Yes	No	No	No	Yes	No	No	No	No	No	No	No	No
Nighttime land surface temperature	No	No	Yes	Yes	No	No	No	No	No	No	No	No	Yes
Difference between daytime and nighttime land surface temperature	No	Yes	Yes	No	No	No	Yes	Yes	Yes	No	Yes	No	Yes
Maternal education	Yes	Yes	Yes	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Supplementary Table 8: Fitted model parameters and final penalised control prior specification

Means and upper and lower quantiles of fitted model parameters for the posterior distribution are given by region. Final penalised control prior $\boldsymbol{\rho_0}$ selection also reported per region. Regions are defined as the following: Andean South America [*ANSA*], Central Asia Eastern Europe [*CAEU*], Caribbean [*CRBN]*, Central sub-Saharan Africa [*CSSA*], Central America [*CTAM*], East Asia [*EAAS*], East sub-Saharan Africa [*ESSA*], North Africa and Middle East [*NAME*], South East Asia, [*SEAS*], South Asia [*SOAS*], Southern sub-Saharan Africa [*SSSA*], Tropical South America [*TRSA*], and Western sub-Saharan Africa [*WSSA*].

Supplementary Table 12a–b: Second administrative level out-of-sample fit metrics

Out-of-sample fit statistics are provided for second administrative levels, by both year and modelling region, along with the number of surveys per year. Regions are defined as the following: Andean South America [*ANSA*], Central Asia Eastern Europe [*CAEU*], Caribbean [*CRBN]*, Central sub-Saharan Africa [*CSSA*], Central America [*CTAM*], East Asia [*EAAS*], East sub-Saharan Africa [*ESSA*], North Africa and Middle East [*NAME*], South East Asia, [*SEAS*], South Asia [*SOAS*], Southern sub-Saharan Africa [*SSSA*], Tropical South America [*TRSA*], and Western sub-Saharan Africa [*WSSA*].

Supplementary Table 14: Age cohort regression coefficients
Coefficients from age cohort only regression analysis of the log of the ratios of coverage between older cohorts and the target cohort among cohorts of children with multiple survey timepoints. t-statistic and corresponding two-side p=values are presented. The t+3 cohort was significant.

	Beta	Std. Error	t-value	p-value
T+1	0.01436	0.02483	0.578	0.5646
T+2	0.05409	0.02786	1.941	0.0556
T+3	0.14564	0.02840	5.129	0.00000184***

Supplementary Table 15: Key analysis findings for multiple age cohort modelling choices
For each modelling version with various cohorting approaches, key results and themes presented in the manuscript are consistent, including proportion of districts with increasing coverage and meeting GVAP targets, as well as inequality metrics and the geographic distribution of children.

	Full cohort model	Target age, t+1 and t+2 cohort model* *Presented as main findings	Target age and t+1 cohort model	Target age cohort only model
Proportion of districts with increased coverage from 2000 to 2019	58.0% (95% UI: 51.1 – 65.6%)	57.4% (95% UI: 50.4– 64.6%)	55.9% (95% UI: 49.3 – 63.8%)	55.5% (95% UI: 49.8 – 61.5%)
Proportion of districts with increased coverage from 2000 to 2010	69.6% (95% UI: 64.9– 74.4%)	70.5% (95% UI: 66.0–75.4%)	67.9% (95% UI: 62.3 – 73.5%)	72.0% (95% UI: 67.6 – 76.3%)
Proportion of districts with increased coverage from 2010 to 2019	41.7% (95% UI: 35.5 – 49.5%)	40.1% (95% UI: 34.2–46.9%)	40.3% (95% UI: 34.5 – 47.6%)	36.9% (95% UI: 32.1 – 42.6%)
Proportion of districts meeting GVAP target in 2000	39.1%	38.4%	37.0%	37.2%
Proportion of districts meeting GVAP target in 2019	34.0%	33.2%	33.1%	34.8%
% of all unvaccinated children living in rural areas	16.2%	16.0%	16.1%	16.2%
% of all unvaccinated children living in urban areas	47.5%	47.9%	48.0%	47.6%
% of children living rural areas that are unvaccinated	33.2%	33.3%	33.1%	33.2%
% of all unvaccinated children living in urban areas	14.9%	15.2%	15.1%	14.9%

Correlation between changes in coverage and absolute inequality from 2000 - 2019	-0.49 (Pearson's product moment correlation, t = -5.65, p = 0.0000001564)	-0.47 (Pearson's product moment correlation, t = -5.36, p = 0.0000005332)	-0.45 (Pearson's product moment correlation, t = -4.95, p = 0.000003044)	-0.53 (Pearson's product moment correlation, t = -6.49, p =0.000000002564)
Number of countries with increasing inequality from 2000 - 2019	23	25	29	25
