# CONSORT-EHEALTH (V 1.6.1) - Submission/Publication Form

The CONSORT-EHEALTH checklist is intended for authors of randomized trials evaluating web-based and Internet-based applications/interventions, including mobile interventions, electronic games (incl multiplayer games), social media, certain telehealth applications, and other interactive and/or networked electronic applications. Some of the items (e.g. all subitems under item 5 - description of the intervention) may also be applicable for other study designs.

The goal of the CONSORT EHEALTH checklist and guideline is to be

- a) a guide for reporting for authors of RCTs,
- b) to form a basis for appraisal of an ehealth trial (in terms of validity)

CONSORT-EHEALTH items/subitems are MANDATORY reporting items for studies published in the Journal of Medical Internet Research and other journals / scientific societies endorsing the checklist.

Items numbered 1., 2., 3., 4a., 4b etc are original CONSORT or CONSORT-NPT (non-pharmacologic treatment) items.

Items with Roman numerals (i., ii, iii, iv etc.) are CONSORT-EHEALTH extensions/clarifications.

As the CONSORT-EHEALTH checklist is still considered in a formative stage, we would ask that you also RATE ON A SCALE OF 1-5 how important/useful you feel each item is FOR THE PURPOSE OF THE CHECKLIST and reporting guideline (optional).

Mandatory reporting items are marked with a red \*.

In the textboxes, either copy & paste the relevant sections from your manuscript into this form - please include any quotes from your manuscript in QUOTATION MARKS, or answer directly by providing additional information not in the manuscript, or elaborating on why the item was not relevant for this study.

YOUR ANSWERS WILL BE PUBLISHED AS A SUPPLEMENTARY FILE TO YOUR PUBLICATION IN JMIR AND ARE CONSIDERED PART OF YOUR PUBLICATION (IF ACCEPTED). Please fill in these questions diligently. Information will not be copyedited, so please use proper spelling and grammar, use correct capitalization, and avoid abbreviations.

DO NOT FORGET TO SAVE AS PDF \_AND\_ CLICK THE SUBMIT BUTTON SO YOUR ANSWERS ARE IN OUR DATABASE !!!

Citation Suggestion (if you append the pdf as Appendix we suggest to cite this paper in the caption):

Usability and preliminary effectiveness of a preoperative mHealth application for patients undergoing major surgery: a pilot randomized controlled trial

Name of your App/Software/Intervention \*

If there is a short and a long/alternate name, write the short name first and add the long name in brackets.

'Be Prepared'

Evaluated Version (if any) e.g. "V1", "Release 2017-03-01", "Version 2.0.27913" prototype
Language(s) * What language is the intervention/app in? If multiple languages are available, separate by comma (e.g. "English, French")
Dutch
URL of your Intervention Website or App e.g. a direct link to the mobile app on app in appstore (itunes, Google Play), or URL of the website. If the intervention is a DVD or hardware, you can also link to an Amazon page.
https://beter-voorbereid.nl/
URL of an image/screenshot (optional)
Jouw antwoord
Accessibility * Can an enduser access the intervention presently?
access is free and open
access only for special usergroups, not open
<ul><li>access is open to everyone, but requires payment/subscription/in-app purchases</li><li>app/intervention no longer accessible</li></ul>
Anders:

Primary Medical Indication/Disease/Condition * e.g. "Stress", "Diabetes", or define the target group in brackets after the condition, e.g. "Autism (Parents of children with)", "Alzheimers (Informal Caregivers of)"
Major Surgery (People with)
Primary Outcomes measured in trial * comma-separated list of primary outcomes reported in the trial
Usability
Secondary/other outcomes  Are there any other outcomes the intervention is expected to affect?
Change of risk behaviours, functional recovery
Recommended "Dose" *  What do the instructions for users say on how often the app should be used?
Approximately Daily
Approximately Weekly
Approximately Monthly
Approximately Yearly
as needed"
O Anders:

Approx. Percentage of Users (starters) still using the app as recommended after 3 months *
unknown / not evaluated
0-10%
11-20%
21-30%
31-40%
41-50%
51-60%
61-70%
71%-80%
81-90%
91-100%
Anders:
Overall, was the app/intervention effective? *
yes: all primary outcomes were significantly better in intervention group vs control
partly: SOME primary outcomes were significantly better in intervention group vs control
on statistically significant difference between control and intervention
outcomes potentially harmful: control was significantly better than intervention in one or more
inconclusive: more research is needed
Anders:

"mHealth application, a smartphone application"

# 1b-iii) Open vs. closed, web-based (self-assessment) vs. face-to-face assessments in the METHODS section of the ABSTRACT

Mention how participants were recruited (online vs. offline), e.g., from an open access website or from a clinic or a closed online user group (closed usergroup trial), and clarify if this was a purely web-based trial, or there were face-to-face components (as part of the intervention or for assessment). Clearly say if outcomes were self-assessed through questionnaires (as common in web-based trials). Note: In traditional offline trials, an open trial (open-label trial) is a type of clinical trial in which both the researchers and participants know which treatment is being administered. To avoid confusion, use "blinded" or "unblinded" to indicated the level of blinding instead of "open", as "open" in web-based trials usually refers to "open access" (i.e. participants can self-enrol). (Note: Only report in the abstract what the main paper is reporting. If this information is missing from the main body of text, consider adding it)

"The 'Be Prepared' mHealth application prototype is a smarthphone app wich uses behaviour change techniques to support patients in optimizing their health and risk behaviours prior to surgery. A behaviour change technique is a strategy that helps an individual change their behaviour to promote better health. Techniques like setting goals, advise on stop-smoking medication or providing information on the consequences of alcohol consumption and alcohol cessation were used in this app (Bartlett, Sheeran, & Hawley, 2014). In the app, participants answered questions about their risk behaviour and received tailored information and advice based on the given answers. Current smokers were supported with smoking cessation prior to surgery. Frequent alcohol users were supported to decrease their alcohol intake. Inactive participants were supported to increase their amount of physical activity to at least 30 minutes moderate-intensity physical activity a day. Participants who did less than twice a week muscle strengthening activities were supported to increase these activities to at least twice a week in combination with protein-rich food. Participants who unintentionally lost more than three kilograms during the past month were advised on protein and energy enriched food. Additionally, participants received information about preoperative fasting and the use of blood coagulation medication prior to surgery.

Participants in the intervention group received access to the 'Be Prepared' app for use on their own mobile device. The introduction screen only showed basic information about the goal and use of the app. They could unlock the extra information and advice by entering a personal code they received via email. The information and advice in the app was displayed on a dynamic timeline based on the patients operation date. Through this dynamic timeline day-to-day information was offered in various ways to meet different needs. The timeline provided written information and videos, advice on changing risk behaviours, quizzes and exercise videos (figure 1). Furthermore, participants were asked whether they succeeded in following the given advice and received feedback based on their response. Push-notifications informed the patient about available new information and advice. This prototype version of the app provided information and advice for a maximum of 14 days prior to surgery. "

"Participants in the intervention group received access to the 'Be Prepared' app for use on their own mobile device. The introduction screen only showed basic information about the goal and use of the app. They could unlock the extra information and advice by entering a personal code they received via email."

# 5-viii) Mode of delivery, features/functionalities/components of the intervention and comparator, and the theoretical framework

Describe mode of delivery, features/functionalities/components of the intervention and comparator, and the theoretical framework [6] used to design them (instructional strategy [1], behaviour change techniques, persuasive features, etc., see e.g., [7, 8] for terminology). This includes an in-depth description of the content (including where it is coming from and who developed it) [1]," whether [and how] it is tailored to individual circumstances and allows users to track their progress and receive feedback" [6]. This also includes a description of communication delivery channels and – if computer-mediated communication is a component – whether communication was synchronous or asynchronous [6]. It also includes information on presentation strategies [1], including page design principles, average amount of text on pages, presence of hyperlinks to other resources, etc. [1].

"The information and advice in the app was displayed on a dynamic timeline based on the patients operation date. Through this dynamic timeline day-to-day information was offered in various ways to meet different needs. The timeline provided written information and videos, advice on changing risk behaviours, quizzes and exercise videos (figure 1). Furthermore, participants were asked whether they succeeded in following the given advice and received feedback based on their response. Push-notifications informed the patient about available new information and advice."

"Descriptive statistics were used to describe patient characteristics and app use. No a priori level of statistical significance was set, as this pilot study was not powered to assess effect. Point estimators and 95% Confidence Intervals (95CI) are given to estimate the effects and p-values are provided to give an impression of the evidence against the null hypothesis. Data analyses were performed according to the intention-to-treat principle. Quantitative data were analyzed using SPSS version 25.0, (IBM, Armonk, United States)" AND "Qualitative analysis of interview data was done following the steps of thematic analysis: compiling, disassembling, reassembling, interpreting, and concluding" AND "Bootstrapping methods (1000 samples) were used to calculate 95CI for medians. Chi-square tests for linear trend were performed to examine the relation between group allocation and change scores in days of performing physical activities and muscle strengthening activities. Chi Square tests, or Fisher's exact tests, were used to test the difference in distribution of self-reported change of all risk behaviours between allocation groups."AND "The between group differences on functional recovery, measured by the post-surgery PROMIS PF corrected for baseline PROMIS PF, were analyzed using multivariable linear regression analysis."

### 12a-i) Imputation techniques to deal with attrition / missing values

Imputation techniques to deal with attrition / missing values: Not all participants will use the intervention/comparator as intended and attrition is typically high in ehealth trials. Specify how participants who did not use the application or dropped out from the trial were treated in the statistical analysis (a complete case analysis is strongly discouraged, and simple imputation techniques such as LOCF may also be problematic [4]).

### **RESULTS**

13a) For each group, the numbers of participants who were randomly assigned, received intended treatment, and were analysed for the primary outcome

NPT: The number of care providers or centers performing the intervention in each group and the number of patients treated by each care provider in each center

### Does your paper address CONSORT subitem 13a? \*

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"Between November 2018 and February 2019 a total of 226 patients were screened for eligibility. Eightysix people were elegible and signed informed consent. Fortyfive participants were randomized to the experimental group and 41 to the control group. In the control group, one participant did not complete baseline questionnaires and was therefore excluded from further analysis. Four participants were excluded from further analysis because their surgery was cancelled. In the intervention group, two participants withdrew informed consent due to nursing home admission and start of palliative care. Thus, there were n=40 and n=39 evaluable participants in the intervention and control group respectively (figure 2). "

13b) For each group, losses and exclusions after randomisation, together with reasons

"The usability of the 'Be Prepared' app scored 68.2 (SD 18.4). " AND "The intervention group became active on more days of the week after the intervention period +1.0 day [95Cl 0.0, +2.0] compared to the control group 0.0 days [95Cl -0.5, +1.0], p = 0.116. "

# 17a-i) Presentation of process outcomes such as metrics of use and intensity of use

In addition to primary/secondary (clinical) outcomes, the presentation of process outcomes such as metrics of use and intensity of use (dose, exposure) and their operational definitions is critical. This does not only refer to metrics of attrition (13-b) (often a binary variable), but also to more continuous exposure metrics such as "average session length". These must be accompanied by a technical description how a metric like a "session" is defined (e.g., timeout after idle time) [1] (report under item 6a).

"The login procedure was difficult for many interviewees and some needed help from family or the research team to log in. One interviewee explained: "I had some trouble opening the app, but then I went back to the instructions and it clearly stated what I had to do" [male, age 65]. The interviewees did not experience problems when using the app: "It is self-explanatory" [male, age 76]."

#### DISCUSSION

# 22) Interpretation consistent with results, balancing benefits and harms, and considering other relevant evidence

NPT: In addition, take into account the choice of the comparator, lack of or partial blinding, and unequal expertise of care providers or centers in each group

22-i) Restate study questions and summarize the answers suggested by the data, starting with primary outcomes and process outcomes (use)

Restate study questions and summarize the answers suggested by the data, starting with primary outcomes and process outcomes (use).

"In this study, 73% of the 40 possible app users activated the app. The difficult login procedure, but also differences in the patient's (digital) health literacy, may have contributed to the substantial number of non-users in the intervention group"

### 21) Generalisability (external validity, applicability) of the trial findings

NPT: External validity of the trial findings according to the intervention, comparators, patients, and care providers or centers involved in the trial

#### 21-i) Generalizability to other populations

Generalizability to other populations: In particular, discuss generalizability to a general Internet population, outside of a RCT setting, and general patient population, including applicability of the study results for other organizations

Not discussed; as this is a pilot trial

## 21-ii) Discuss if there were elements in the RCT that would be different in a routine application setting Discuss if there were elements in the RCT that would be different in a routine application setting (e.g., prompts/reminders, more human involvement, training sessions or other co-interventions) and what impact the omission of these elements could have on use, adoption, or outcomes if the intervention is applied outside of a RCT setting. 1 2 3 subitem not at all important essential Does your paper address subitem 21-ii? About the CONSORT EHEALTH checklist
As a result of using this checklist, did you make changes in your manuscript? *  yes, major changes
yes, minor changes  no
What were the most important changes you made as a result of using this checklist?
Mentioning trial registration
How much time did you spend on going through the checklist INCLUDING making changes in your manuscript *
45 min

As a result of using this checklist, do you think your manuscript has improved? *
O yes
o no
O Anders:
Would you like to become involved in the CONSORT EHEALTH group?  This would involve for example becoming involved in participating in a workshop and writing an "Explanation and Elaboration" document
O yes
o no
O Anders:
