Note. Unpleasantness refers to ratings of visual unpleasantness during the visual task. ns = not significant; fdr = false discovery rate; * denotes contrasts pertinent to study's primary hypotheses.

Supplementary Figure 1. Density plots of moderating pain and somatic symptom variables in second level regression models. The participants had a wide range of menstrual pain, bladder pain, and somatic symptom scores amenable for regression modeling. Y-axis (density) represents the concentration of points about a continuous x-axis measure. VAS = visual analog scale (0 – no pain, 100 – worst pain imaginable).

Supplementary Figure 2. Partial regression (added variable) scatter plots depicting the moderating relationship between (a) menstrual pain and brightness slopes [b_1] and (b) bladder pain and PSD slopes [b_2] at electrode Oz. These plots depict the unique relationship between the moderating variable (x-axis) and the dependent variable (y-axis) after accounting for the other predictors in the second level models. PSD = power spectral density (25Hz).
