

Online supplementary figure 2. Percentage of people living with HIV in 25 countries who reported sharing their HIV status, within four mutually exclusive strata of age and gender, Positive Perspectives Study, 2019

Note: All results were statistically significant using χ^2 tests, meaning that for each outcome assessed, at least two of the groups differed significantly at $p < 0.05$. Total sample size across the four strata does not add up to 2389 because of 70 respondents who identified with a gender other than 'man' or 'woman'
