

Description of Additional Supplementary Files

Supplementary Movie 1: Major structural differences between models of monomeric and dimeric nucleosome-bound forms of PRC2:EZH1.

Model of PRC2:EZH1 monomer morphing to the dimeric PRC2:EZH1 bound to a nucleosome. Rotations of the lower lobe of PRC2:EZH1 and the SUZ12 C2 domain are shown. Rotations represent morphing of the two final static models and do not imply actual movements.
