

A pharmacogenetics study of platinum-based chemotherapy in lung cancer: *ABCG2* polymorphism and its genetic interaction with *SLC31A1* are associated with response and survival

Liyan Wang, Chang Sun, Xiangnan Li, Chenxue Mao, Ji Qian, Jiucun Wang, Junjie Wu, Qiang Li, Chunxue Bai, Baohui Han, Zhiqiang Gao, Jibin Xu, Jiye Yin, Zhaoqian Liu, Daru Lu, Li Jin and Haijian Wang

Supplemental Materials

Supplemental Table 1. *ABCG2* tag and potentially functional SNPs genotyped in the cohort of NSCLC patients

Supplemental Table 2. Association between *ABCG2* SNPs and response

Supplemental Table 3. Stratification analysis of association between *ABCG2* SNPs and response

Supplemental Table 4. Association between *SLC31A1* rs2233914 (G/A) and response

Supplemental Table 5. The ORR related to the joint effects of *SLC31A1* rs2233914 (G/A) and *ABCG2* rs2231142 (A/C) polymorphisms

Supplemental Table 6. Association between *ABCG2* SNPs and survival

Supplemental Table 7. Stratification analysis of association between *ABCG2* polymorphisms and overall survival

Supplemental Table 8. Joint association of *SLC31A1* rs10759637 (A/C) and *ABCG2* rs2231142 (C/A) with overall survival

Supplemental Table 9. Genotypic distribution of *ABCG2* SNPs between NSCLC patients with mild or severe toxicological outcomes

Supplemental Table 10. Association between *ABCG2* SNPs and toxicity outcomes

Supplemental Table 11. Association between objective response rate and overall survival

Supplemental Table 12. Association between objective response rate and progression free survival

Supplemental Figure 1. Schematic structure of *ABCG2* gene and linkage disequilibrium of its candidate SNPs in the NSCLC cohort

Supplemental Figure 2. Kaplan-Meier curve of estimated overall survival for the NSCLC cohort according to *ABCG2* rs2231142 and *SLC31A1* rs10759637 polymorphisms

Supplemental Table 1. *ABCG2* tag and potentially functional SNPs genotyped in the cohort of NSCLC patients

^a For each SNP, three different genetic models (dominant, recessive and under-dominant) were analyzed, and the model with lowest *P* values was considered the best-fitting model.

^b Odds ratios (OR) and their 95% confidence intervals (CIs) and *P* values were calculated with unconditional logistic regression analysis, with adjustment of gender, age, smoking status, ECOG performance status, TNM status, histological types, and treatment regimen.

Supplemental Table 4. Association between *SLC31A1* rs2233914 (G/A) and response

Genotype ^a	Response (CR+PR/SD+PD)	<i>P</i> value ^b	OR(95%CI) ^c	<i>P</i> value ^c
G/G	95/352	0.052	1.00 (ref)

^a Numbers indicate the death event for NSCLC patients during the following-up time among all individuals in the same genotype group.

^b MST: median survival time.

^c Hazard ratios (HR) and their 95% confidence intervals (CIs) and *P* values were calculated with by multivariate Cox proportional hazards regression with adjustment for covariates.

^d Numbers indicate patients who suffered of disease progression (including death) during the following-up time among all individuals in the same genotype group.

^e Statistical significance remained after Bonferroni multiple tests.

Supplemental Table 7. Stratification analysis of association between *ABCG2* polymorphisms and overall survival

^a Numbers indicate the death event for NSCLC patients during the following-up time among all individuals in the same genotype group.

^b MST: median survival time.

^c Log-rank tests for association between survival and overall genotypes.

^d Hazard ratios (HR) and their 95% confidence intervals (CIs) and *P* values were calculated with by multivariate Cox proportional hazards regression with adjustment for covariates. Dominant models were used to estimate the HRs for the two SNPs.

^e Statistical significance remained after Bonferroni multiple tests.

Supplemental Table 8. Joint association of *SLC31A1* rs10759637 (A/C) and *ABCG2* rs2231142 (C/A) with overall survival

^a *SLC31A1* rs2233914 (G/A) for the study subjects had been genotyped in our previous report (Ref 9).

^b Numbers indicate the death event for NSCLC patients during the following-up time among all individuals in the same genotype group.

^c MST: median survival time.

^d Hazard ratios (HR) and their 95% confidence intervals (CIs) and *P* values were calculated with by multivariate Cox proportional hazards regression with adjustment for covariates.

^e Test of interaction for the cohort of all patients with *P* value being 0.007.

^f Statistical significance remained after Bonferroni multiple tests.

^a *P* values of Pearson χ^2 tests for overall distributions for SNPs genotypes between severe and mild toxicological phenotypes.

^b Odds ratios (OR) and their 95% confidence intervals (CIs) and *P* values were calculated with unconditional logistic regression analysis, with adjustment of gender, age, smoking status, ECOG performance status, TNM status, histological types, and treatment regimen.

Supplemental Table 11. Association between objective response rate and overall survival

Stratification subgroup		Overall survival						
		n/N ^a		MST (m) ^b		Log-rank <i>P</i> ^c	HR (95%CI) ^d	<i>P</i> ^d

^a Numbers indicate the death event for NSCLC patients during the following-up time among all individuals in the same response or nonresponse group.

^b MST: median survival time.

^c Log-rank tests for association between survival and overall response.

^d Hazard ratios (HR) and their 95% confidence intervals (CIs) and *P* values were calculated with by multivariate Cox proportional hazards regression with adjustment for covariates.

Supplemental Table 12. Association between objective response rate and progression free survival

^a Numbers indicate the event for NSCLC patients during the following-up time among all individuals in the same response or nonresponse group.

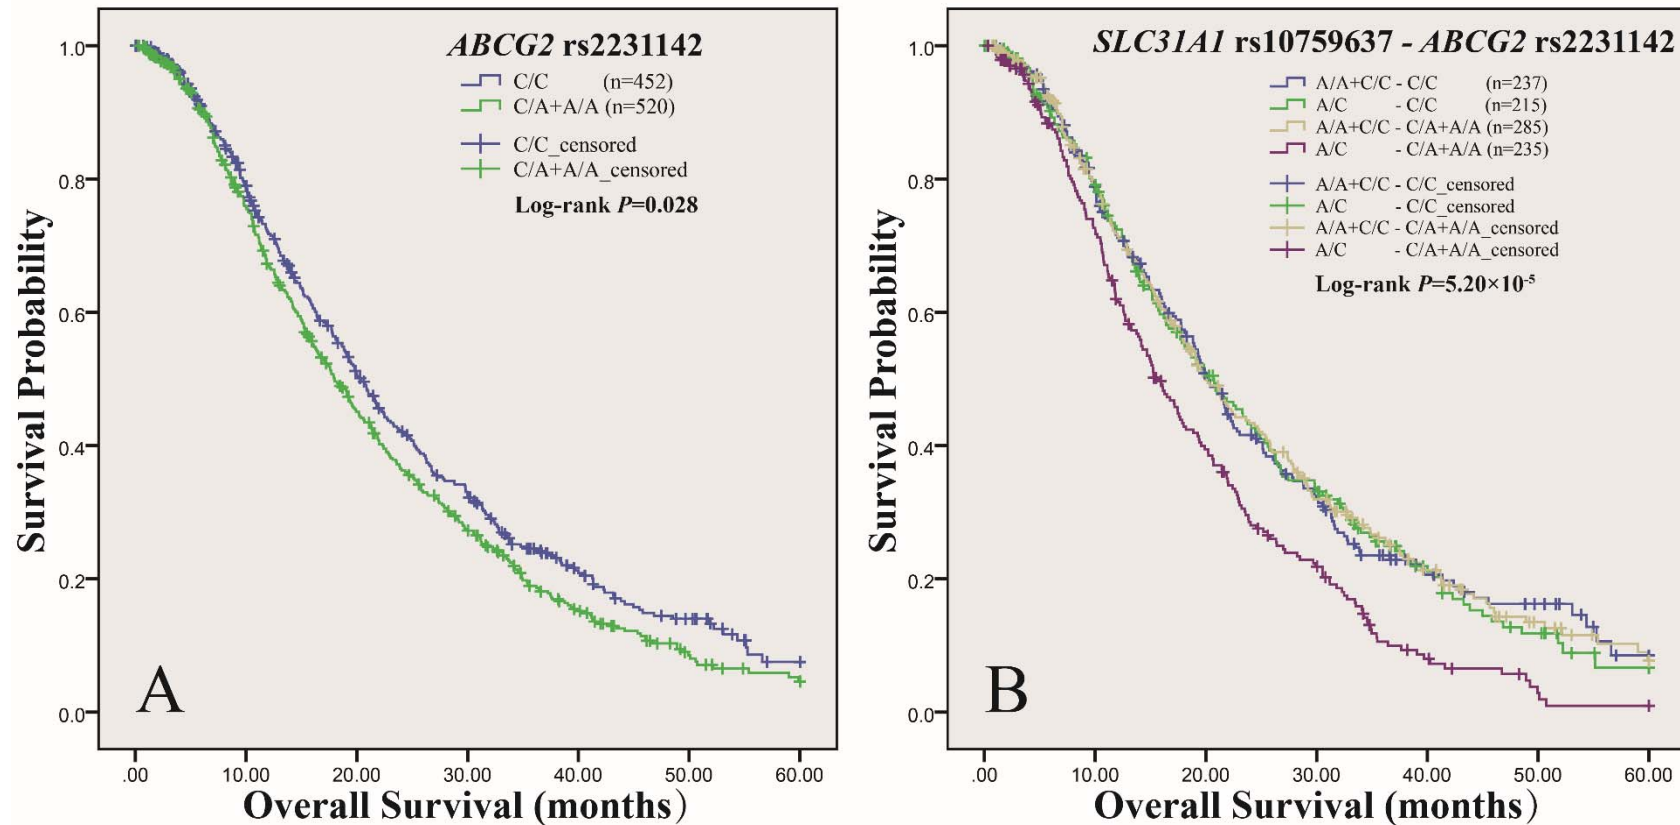

^b MST: median survival time.

^c Log-rank tests for association between PFS and overall response.

^d Hazard ratios (HR) and their 95% confidence intervals (CIs) and *P* values were calculated with by multivariate Cox proportional hazards regression with adjustment for covariates.

Supplemental Figure 1 Schematic structure of *ABCG2* gene and linkage disequilibrium of its candidate SNPs in the NSCLC cohort. The color intensity is proportional to D' and the percent numbers represent r^2 .

Supplemental Figure 2 Kaplan-Meier curve of estimated overall survival for the NSCLC cohort according to *ABCG2* rs2231142 and *SLC31A1* rs10759637 polymorphisms. The curves were plotted with SPSS software according to the genotypes of *ABCG2* rs2231142 (A) and the combined genotypes of *ABCG2* rs2231142 and *SLC31A1* rs10759637 (B). For rs2231142 C/A, the C/A+A/A genotypes group was compared to the wild C/C as reference in dominant model. For rs10759637 A/C, the A/C heterozygote was compared to the A/A+C/C homozygotes group as reference in under-dominant model.
