

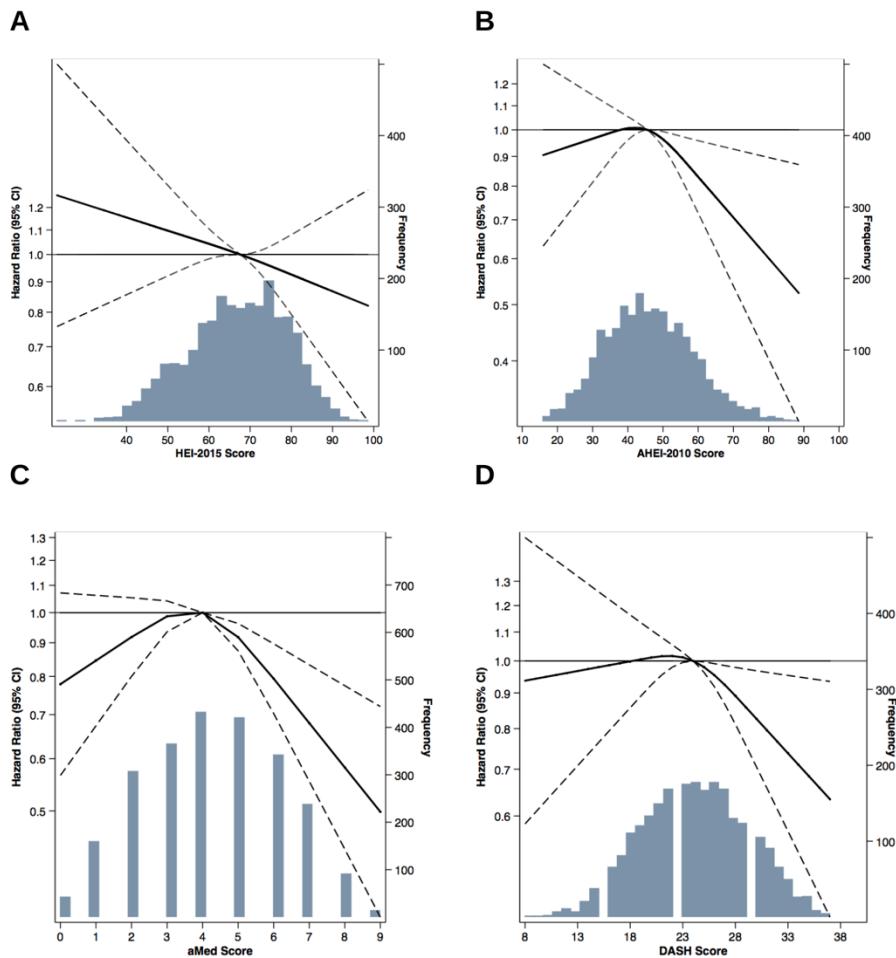

Figure S1. Restricted cubic spline plot of adjusted hazard ratios for CKD progression by dietary score.

(A) HEI-2015; (B) AHEI-2010; (C) aMed; (D) DASH. Adjusted for total energy intake, clinical site, age, sex, race, education, income level, estimated glomerular filtration rate, urinary protein, smoking status, physical activity, alcohol status (for HEI-2015 and DASH scores), body mass index, diabetes mellitus, hypertension, cardiovascular disease, high-density lipoprotein cholesterol, and angiotensin-converting enzyme inhibitor or angiotensin II receptor blocker use. Histogram displays the distribution of study participants according to scores for each dietary pattern. Solid line represents the adjusted HR (on logarithmic scale) and dashed lines represent the 95% confidence interval. Knots placed at 55, 68, and 79 for HEI-2015; 34, 46, and 58 for AHEI-2010; 2, 4, and 6 for aMed; and 19, 24, and 29 for DASH. AHEI, Alternative Healthy Eating Index; aMed, alternate Mediterranean diet; DASH, Dietary Approaches to Stop Hypertension; HEI, Healthy Eating Index.

^a Cox proportional hazards models to estimate hazard ratios and 95% confidence intervals. Model 1 was adjusted for total energy intake, clinical site, age, sex, race, education, income level, estimated glomerular filtration rate, urinary protein, smoking status, physical activity, and alcohol status (for HEI-2015 and DASH scores), body mass index, diabetes mellitus, hypertension, cardiovascular disease, high-density lipoprotein cholesterol, and angiotensin-converting enzyme inhibitor or angiotensin II receptor blocker use. AHEI, Alternative Healthy Eating Index; aMed, alternate Mediterranean diet; CRP, C-reactive protein; DASH, Dietary Approaches to Stop Hypertension; FGF-23; fibroblast growth factor-23; HEI, Healthy Eating Index; ref, reference.

^b P refers to p-value for a test of linear trend. Trend was tested using the median value within each tertile
