Staples, Ashish Yadav, Dadong Li, Marcus B. Jones, Lyndon J. Mitnaul

eMethods. Exome sequencing and variant calling

Clinical laboratory referral cohort: Exome sequencing was performed at GeneDx using previously reported protocols.¹ In brief, genomic DNA was extracted from whole blood, oral rinse, or ORAcollect swabs (DNAGenotek, Ontario, Canada) obtained from the proband and any additional submitted family members. Exome sequencing was performed on exon targets isolated by Agilent SureSelect Human All Exon V4 or Clinical Research Exome (Agilent Technologies, Santa Clara, CA) or xGen Exome (IDT, Coralville, IA) capture and sequenced using Illumina HiSeq 2000, 2500, 4000 or NovaSeq 6000 paired-end reads (Illumina, San Diego, CA). DNA sequence was mapped to human genome build UCSC hg19/GRCh37 reference sequence using Burroughs Wheeler Aligner (BWA) with the latest internally validated version at the time of sequencing, progressing from BWA v0.5.8 through BWA-MEM v0.7.8.² Variant calls were generated using both SAMtools and Genome Analysis Toolkit (GATK) UnifiedGenotype or HaplotypeCaller, progressing over time from version 0.1.18 to 1.5.0 and 1.5 to 3.7, respectively.^{3,4} Copy number variants (CNVs) and mobile element insertions were also called from exome sequencing data using a relative coverage method as described previously.^{5,6} Exome sequencing data was analyzed using GeneDx's XomeAnalyzer, a variant annotation, filtering, and analysis platform. Reported variants were confirmed by an appropriate orthogonal method.

Healthcare-based cohort: Exome capture was performed using either NimbleGen SeqCap EZ VCRome (Roche, Basel, Switzerland) or xGen (IDT, Coralville, IA) kits according to the manufacturer's recommended protocol. Multiplexed samples were sequenced on an Illumina v4 HiSeq 2500 (Illumina, San Diego, CA). Raw sequence data were uploaded to the DNAnexus platform for sequence read alignment and variant identification. Reads were aligned to the GRCh38/hg38 reference genome using BWA-MEM.² Variants were called separately by VCRome and xGen exome capture. The final VCF was annotated with dbNSFP v3.3a,⁷ Variant Effect Predictor (version 96.1) with the LOFTEE plugin,⁸ and ClinVar (downloaded January 26, 2018).⁹ CNVs were called from exome sequencing using the Copy number estimation using Lattice-Aligned Mixture Models (CLAMMS) algorithm as previously described.^{10,11} CNVs called from exome sequencing were orthogonally confirmed with available genotype array data (Illumina Global Screening Array or Illumina OmniExpressExome) using the CNV caller PennCNV.¹² A population MAF in publicly available control databases, such as the genome aggregation database (gnomAD), of <0.001% was used to define rare recessive variants and <0.0005 for rare dominant variants.

eTable 1. Clinical laboratory referral cohort pathogenic/likely pathogenic variants
