

Supplementary Table S5. Primer pairs used on RT-qPCR reactions. Primers were designed using *Primer3 version 4.1.0* web-program, in order to present 60 °C of annealing temperature and amplicon sizes ranging from 95 to 105 base pairs (bp).

1. This primer pair anneals in the *kpfR* gene at a position upstream to the RNA intron insertion site on *kpfR*.
