

Supplementary Figure 1 (S1)

Supplementary Figure 1 (S1). Genotyping of McGill-R-Thy1-APP Heterozygous Tg rats. Tg+/- rats were identified following PCR by the presence of a 377bp amplicon from NM_000484.4 - Homo sapiens amyloid beta precursor protein - hAPP - transgene. The lower band present in both wt and Tg+/- rats corresponds to the 207bp amplicon from XM_006234324.3 - Rattus norvegicus peptidylprolyl isomerase G - Ppig - gene, used as an internal control. DNA from rats previously genotyped and characterized was used as positive and negative controls. A representative set of samples is shown.
