eTable 2 Definition of Congenital Malformations.

Malformation Group	Malformation Subgroup	ICD-9 Dx Code
Cardiovascular Anomalies	Conotruncal Defects	745.0x, 745.1x, 745.2x
	Single Ventricle	745.3x
	Ventricular Septal Defect	745.4x
	Secundum Atrial Septal Defect/Patent Foramen Ovale	745.5x AND no preterm
	Atrioventricular Septal Defect	745.6x
	Right Sided Defects	746.00, 746.01, 746.09, 746.1x, 746.2x, 746.83, 747.3x AND no preterm, 746.02 AND no preterm
	Left Sided Defects	747.1x, 747.2x, 746.3x, 746.5x, 746.7x, 746.81, 746.82, 746.84
	Patent Ductus Arteriosus	747.0x AND no preterm
	Persistent Pulmonary Hypertension of the Newborn	(416.0x or 747.83) AND no preterm
	Anomalous Pulmonary Venous Return	747.4x
	Other Cardiac Malformation	745.7x, 745.8x, 746.8, 746.85-746.87, 746.89
	Cardiac Malformation NOS	745, 745.9, 746, 746.9x (exclude if only 746.99), 747
Central Nervous System	Overall	740.xx-742.xx
	Microcephaly	742.1x
	Hydrocephaly	742.3x
	Reduction Deformities of Brain	742.2x
	Neural tube Defects	741.xx, 756.17, 740.0x, 740.2x, 742.0x
Club Foot		754.50, 754.51, 754.59, 754.60, 754.62, 754.69, 754.70, 754.71, 754.79
Gastroschisis		756.73 if coded after 9/2009;
		756.79 AND ICD-9 Proc 54.71 if coded before 10/2009
Oral Cleft	Cleft Palate	749.0x
	Cleft Lip	749.1x
	Cleft Palate with Cleft Lip	749.2x
Eye Anomalies		743.xx (exclude if only 743.6x and 743.8x)
Ear Anomalies		744.xx (exclude if only 744.1x, 744.21, 744.29, and 744.4x-744.9x)

Malformation Group	Malformation Subgroup	ICD-9 Dx Code
Other Vascular (Non-Cardiac) Anomalies		747.6x-747.9x (exclude if only 747.83)
Respiratory Anomalies		748.xx (exclude if only 748.1x)
Gastrointestinal Anomalies		750.xx-751.xx (exclude if only 750.0x, 750.1x, 750.50, 751.0x)
Genital (Male and Female) Anomalies		752.xx (exclude if only 752.42, 752.52) (in addition, exclude 752.5x if preterm)
Urinary Anomalies		753.xx (exclude if only 753.7x)
Musculoskeletal Anomalies		754.xx and 756.xx (exclude if only 754.3x, 754.81, 754.82, 756.2x)
Limb Defects		755.xx (exclude if only 755.65)
Other Anomalies		757.xx; 759.xx (exclude if only 757.2-757.6, 759.81-759.83)

Abbreviations: Dx, diagnosis; Proc, procedure; NOS, not otherwise specified.

Consider claims in infant record between date of birth (DoB) and DoB+90 days and/or in the maternal record between delivery and delivery+30 days, using both in- and out-patient data.

Subgroups of Cardiovascular Malformations:

- If there are ≥ 2 dates with a code for a malformation within the group
 - Exception: Codes 747.3x, 746.02, 745.5x, 747.0x require ≥ 2 dates with a code for a malformation of which at least one code is documented at ≥ 6 weeks after DoB
- ≥ 1 date with a code for a malformation within the subgroup and cardiac procedure
 - Exception: Code 746.02
- ≥ 1 date with a code for a malformation within the subgroup and infant died
- If codes identified in the maternal record between LMP and LMP+105 AND there are no codes in the infant record between DoB and DoB+90 days (i.e., only maternal codes between delivery and delivery+30), the defect is considered a pre-existing maternal defect.

Cardiovascular Malformations overall:

- Any of the subgroups of cardiovascular anomalies is present
- ≥ 2 dates with a code for any of the cardiac malformations (regardless of the subgroup [1])
- ≥ 1 date with a code for any of the cardiac malformations [1] and cardiac procedure
- ≥ 1 date with a code for any of the cardiac malformations [1] and infant died
- If codes identified in the maternal record between LMP and LMP+105 AND there are no codes in the infant record between DoB and DoB+90 days (i.e., only maternal codes between delivery and delivery+30), the defect is considered a pre-existing maternal defect.

Specific Non-Cardiovascular Malformations:

- ≥ 2 dates with a code for the malformation group/subgroup

- Exception: for gastroschisis: if code 756.79 was used (before 10/2009), require ≥ 1 date with a code AND ICD-9 Proc 54.71
- ≥ 1 date with a code for the malformation group/subgroup and malformation-specific procedure
- ≥ 1 date with a code for the malformation group/subgroup and infant died
- If codes identified in the maternal record between LMP and LMP+105 AND there are no codes in the infant record between DoB and DoB+90 days (i.e., only maternal codes between delivery and delivery+30), the defect is considered a pre-existing maternal defect.

Any Congenital Malformation:

- Any of the malformation groups/subgroups mentioned above is present.

[1] the following codes should not be considered: 745.4x, 745.5x, 747.0x, 746.4x, 746.6x, 746.99, 747.3x if preterm, 746.02 if preterm, 747.5x, 416.0x if preterm, 747.83 if preterm, 746.08, 746.105

Appendix 1 Cohort Selection

Cohorts were restricted to women aged 12 to 55 years. To ensure accurate capture of relevant diagnoses, procedures, and medication exposures, we required women in the cohorts to have insurance coverage from at least 3 months prior to the date of the estimated last menstrual period (LMP) to at least 1 month after delivery. We also required that infants had insurance coverage for at least the first 3 months after birth (unless they died sooner in which case a shorter period of coverage was allowed). For Medicaid beneficiaries, we restricted our analysis to women and infants without restricted benefits, private insurance, or certain capitated managed care programs that underreport claims to the Medicaid Analytic eXtract.⁽¹⁾ We excluded pregnancies in which mothers were exposed to known teratogens during the first trimester and pregnancies with an infant with a chromosomal abnormality. Finally, we excluded pregnancies of women with diagnoses indicating an opioid use disorder or who were treated with opioid replacement therapy (as shown in Supplementary Figures 1-2) given that the focus of the present study is on the risks associated with prescription opioid analgesics.

Appendix 2 Validation Study Description and Results

As part of this study, we validated claims-based algorithms for identifying the primary outcomes of interest - Ventricular Septal Defects (VSD), Secundum Atrial Septal Defects/Patent Foramen Ovale (ASD/PFO), Neural Tube Defects (NTD), Club Foot, and Oral Clefts - using hospital medical records.

Using the Mass General Brigham (MGB) Research Patient Data Registry – a centralized clinical data warehouse of patients receiving care at MGB affiliated hospitals in the Boston area – we identified infants born between 2008 and 2014 who had a malformation of interest based on algorithms using ICD-9 and CPT diagnostic and procedural codes in the infant claims (as described in Supplementary Table 1). To avoid inclusion of rule-out diagnosis or coding errors, a malformation was considered present if a diagnosis was recorded on ≥ 2 different dates, or if only recorded on 1 date, associated with a specific therapeutic procedure or surgery code or infant death shortly after birth. Since we cannot distinguish ASD from prematurity-related PFO based on ICD-9 codes, we excluded ASD/PFO diagnoses in preterm infants and required diagnostic codes to persist for ≥ 6 weeks. Medical charts of algorithm-identified cases were independently reviewed by two physicians to assess the presence of the outcome. Reviewer pairs were asked to reevaluate cases together and attempt to achieve consensus whenever there was disagreement. Positive predictive values (PPVs) and 95% confidence intervals (CIs) were calculated, using medical charts as the gold standard.

50 randomly sampled cases were considered for each outcome, except for NTD for which all 24 cases identified in the database were reviewed. Medical charts were missing for 1 case of VSD, 1 case of NTD and 1 case of Oral Cleft. All 49 retrievable VSDs were classified as true positives (PPV=100%; 95% CI=91%, 100%). All 50 ASD/PFO cases were either true ASDs (N=18) or PFOs (N=32), resulting in a PPV of 100% (91%, 100%). PPVs were 74% (51%, 89%) for NTD, 98% (88%, 100%) for Club Foot and 96% (85%, 99%) for Oral Cleft, see Appendix Table 1.

Appendix Table 1 Positive Predicted Values of Validated Malformations.

Malformation	# True Positives	# False Positives	Total	Charts N/A	PPV (95% CI)
Ventricular Septal Defect	49	0	49	1	1.00 (0.91 - 1.00)
Neural Tube Defect	17	6	23	1	0.74 (0.51 - 0.89)
Club Foot	49	1	50	0	0.98 (0.88 - 1.00)
Secundum Atrial Septal Defect/Patent Foramen Ovale	18 ASD/32 PFO	0	50	0	1.00 (0.91 - 1.00)
Oral Cleft	47	2	49	1	0.96 (0.85 - 0.99)

Abbreviations: ASD, secundum atrial septal defect; CI, confidence interval; N/A, not available; PFO, patent foramen ovale; PPV, positive predictive value.

Appendix 3 Quantifying the Potential Effect of Restriction to Live Births

The study cohorts consisted of live births and did not include pregnancies ending in stillbirth, spontaneous abortion or therapeutic abortion.

If the frequency of live births is the same among opioid-exposed and unexposed pregnancies, within levels of covariates included as potential confounders, then the relative risk (RR) estimates as they were obtained from our analyses are unbiased.

If, however, non-live births occur with a higher frequency among opioid-exposed vs. unexposed pregnancies, then estimates from our main analyses may be biased towards the null. To assess this potential bias, we quantified the potential impact of missing non-live births (including stillbirth, spontaneous abortion and therapeutic abortion) using methods that have previously been described in detail and have been employed by our team in prior evaluations of teratogenic potential of select medications(2-6). The approach used estimates the true (corrected) RR at the time of the occurrence of the defect as a function of the observed association and the probabilities of survival until birth as follows:

Corrected RR = observed RR * (S10*S01/S11*S00), with

S10 being the probability of livebirth among unexposed infants with the malformation of interest;

S11 being the probability of livebirth among exposed infants with the malformation of interest;

S00 being the probability of livebirth among unexposed infants without the malformation of interest;

S01 being the probability of livebirth among exposed infants without the malformation of interest.

Bias does not occur unless both the malformation of interest and the exposure affect the probability of livebirth. The selection probabilities would otherwise cancel out.

In the approach used we assumed a frequency of non-live births in non-malformed fetuses of 20%, corresponding to a livebirth probability of 80%. Using literature-based estimates of the frequency of termination for recognized malformations, we modeled a range of livebirth probabilities in the unexposed malformed, from 55% to 80% for all malformations of interest (lower probabilities are considered unrealistic)(7). We then assessed the potential impact of a 10% to 20% lower frequency of livebirths among the opioid exposed (within levels of covariates adjusted for through the use of propensity scores) on the fully adjusted RR (see Appendix Table 2).

Appendix Figures 1 through 6 show the range of plausible values for the corrected RR. Even under the most extreme assumption of at least 45% non-live births among unexposed infants with the malformation of interest and 65% non-live births among opioid-exposed infants, the RR would remain below 1.30 for all malformations of interest.

Of note, this analysis was not conducted for oral clefts as non-syndromic oral clefts do not result in fetal death and are rarely a reason for terminations.(7, 8)

Appendix Table 2 Probability of Live Birth

Pregnancies with malformation		Pregnancies without malformation	
Unexposed (S10)	Exposed (S11)	Unexposed (S00)	Exposed (S01)
55-80%	S10-20%	80%	S00-20%
	S10-10%		S00-10%
	S10		S00

Appendix 4 Sensitivity Analysis of Residual Confounding to Explain Increase in Oral Clefts

With an observed prevalence of 12.8% among exposed and 2.2% among unexposed Medicaid insured women, and 4.95% among exposed and 0.48% among unexposed commercially insured women, tobacco use is likely to be incompletely captured in claims data. The Centers for Disease Control and Prevention estimate that 7.2% of women smoke cigarettes during pregnancy, with strong variations by race/ethnicity, maternal age and social economic status.(9)

To quantify the potential impact of residual confounding (e.g., by incompletely measured tobacco use or other factors), an approach that has been referred to as the target-adjustment sensitivity analysis(10, 11) will be used. This approach assesses the extent of confounding necessary to fully explain the observed findings if in truth there is no association, i.e. under the null.

Appendix Figures 7 and 8 display the strengths of the association between opioid exposure during the first trimester and a potential unmeasured/incompletely captured confounder (e.g., tobacco use) (displayed as odds ratio (OREC)) and the association between the potential confounder and the outcomes of interest (oral cleft overall & cleft palate) (displayed as relative risk (RRCD)) that would be required to fully explain the observed increased risk of the outcome associated with opioid exposure (pooled adjusted RR=1.21 for oral cleft & 1.62 for cleft palate) if in truth no such increase existed ("True" RR=1).

For an unmeasured confounder present in 10% or 20% of the population, relative risks of 2.5 or more linking the hypothetical confounder to both opioid exposure and oral cleft (and approximately 4 for cleft palate) would be needed to fully explain the observed association. For a confounder present in 1.8% of the population (which would correspond to the observed prevalence of tobacco use among exposed and unexposed women in both cohorts together), relative risks of at least 5 for oral clefts and greater than 8 for cleft palates would be needed. These required associations are unrealistically high, especially since previous literature suggested only a modest association between smoking and oral cleft (OR=1.22).(12)

Appendix Figures 8-9 Sensitivity analysis of residual confounding by and unmeasured or incompletely measured confounder such as tobacco use (rule-out approach) for the estimated pooled adjusted relative risk of 1.21 for oral cleft and 1.77 for cleft palate and different levels of confounder prevalence (PC=1.8%, 10%, 20%).

Fig 7 Oral Cleft

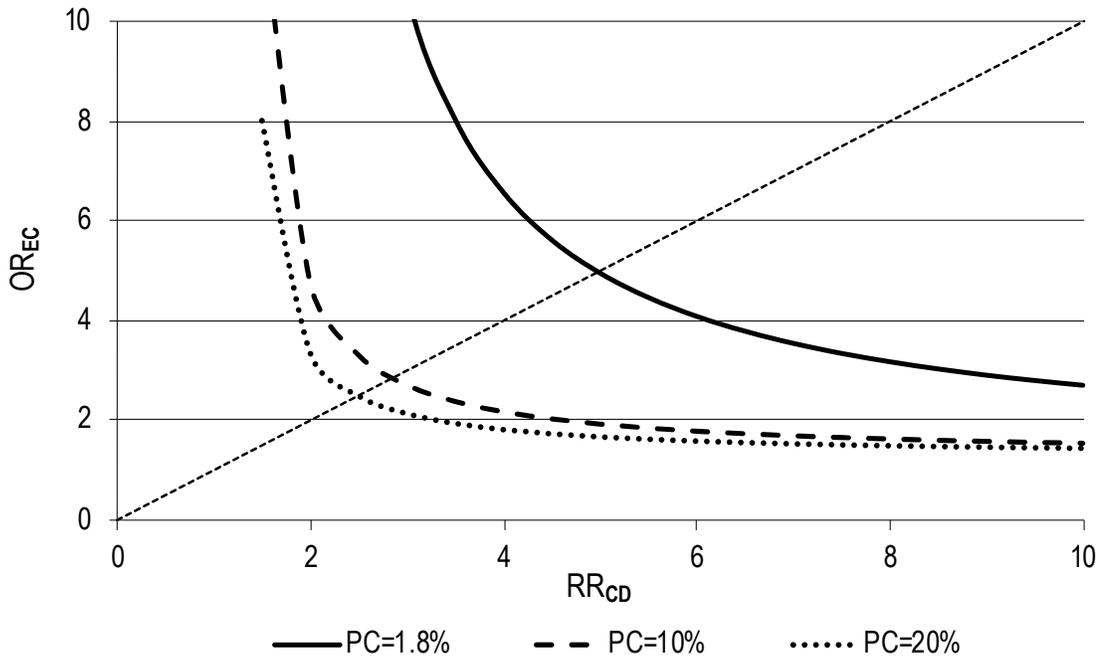

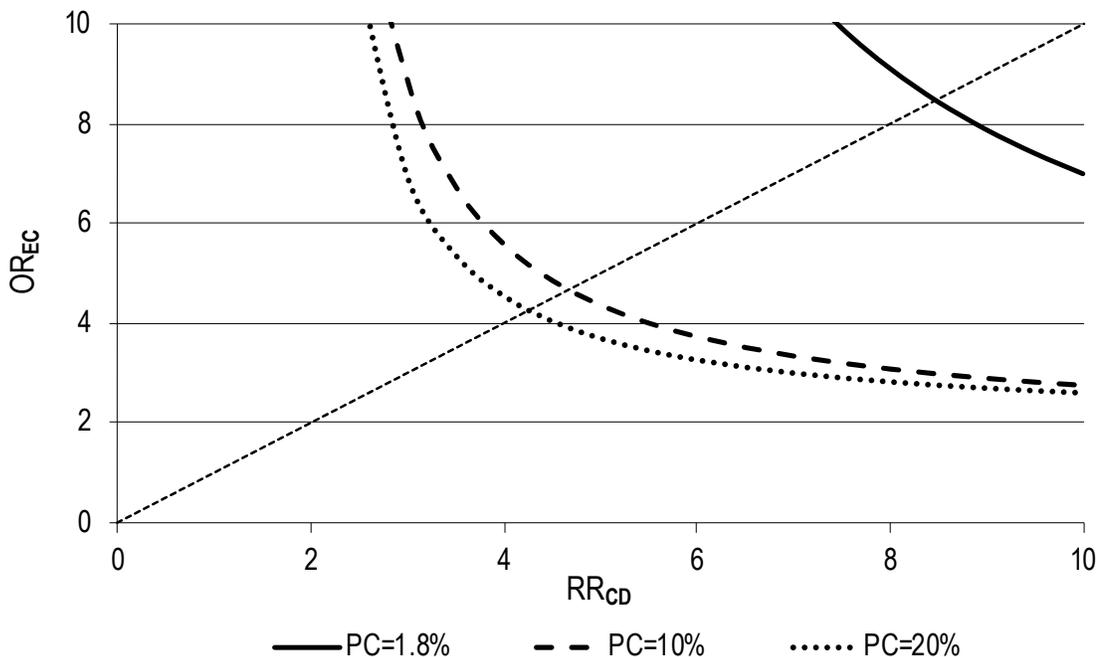

Fig 8 Cleft Palate

Note: Each line splits the area into two. The upper right area represents all combinations of an association between exposure and confounder (OREC) and an association between confounder and outcome (RR_{CD}) that would create confounding by an unmeasured factor strong enough to move the point estimate of RR to the null value (RR = 1) or beyond. The area to the lower left represents all parameter combinations that would not be able to move the estimated RR toward the null.
