

Figure S3. Aminotransferase Protein Levels in Human Tissue Lysates

An equivalent amount of tissue lysate, normalized by total protein concentration, was loaded for each sample [N=6 per tissue]. Samples were probed with anti-human-ALT1 -ALT2, -AST1, or -AST2 antibody. Recombinant ALT1, ALT2, AST1, or GST-AST2 fusion protein [MW ~74 kDa] protein was loaded as a positive control. Note that the GST-AST2 fusion protein control migrates at a higher molecular weight than the endogenous AST2 protein.
