Supplementary Figure

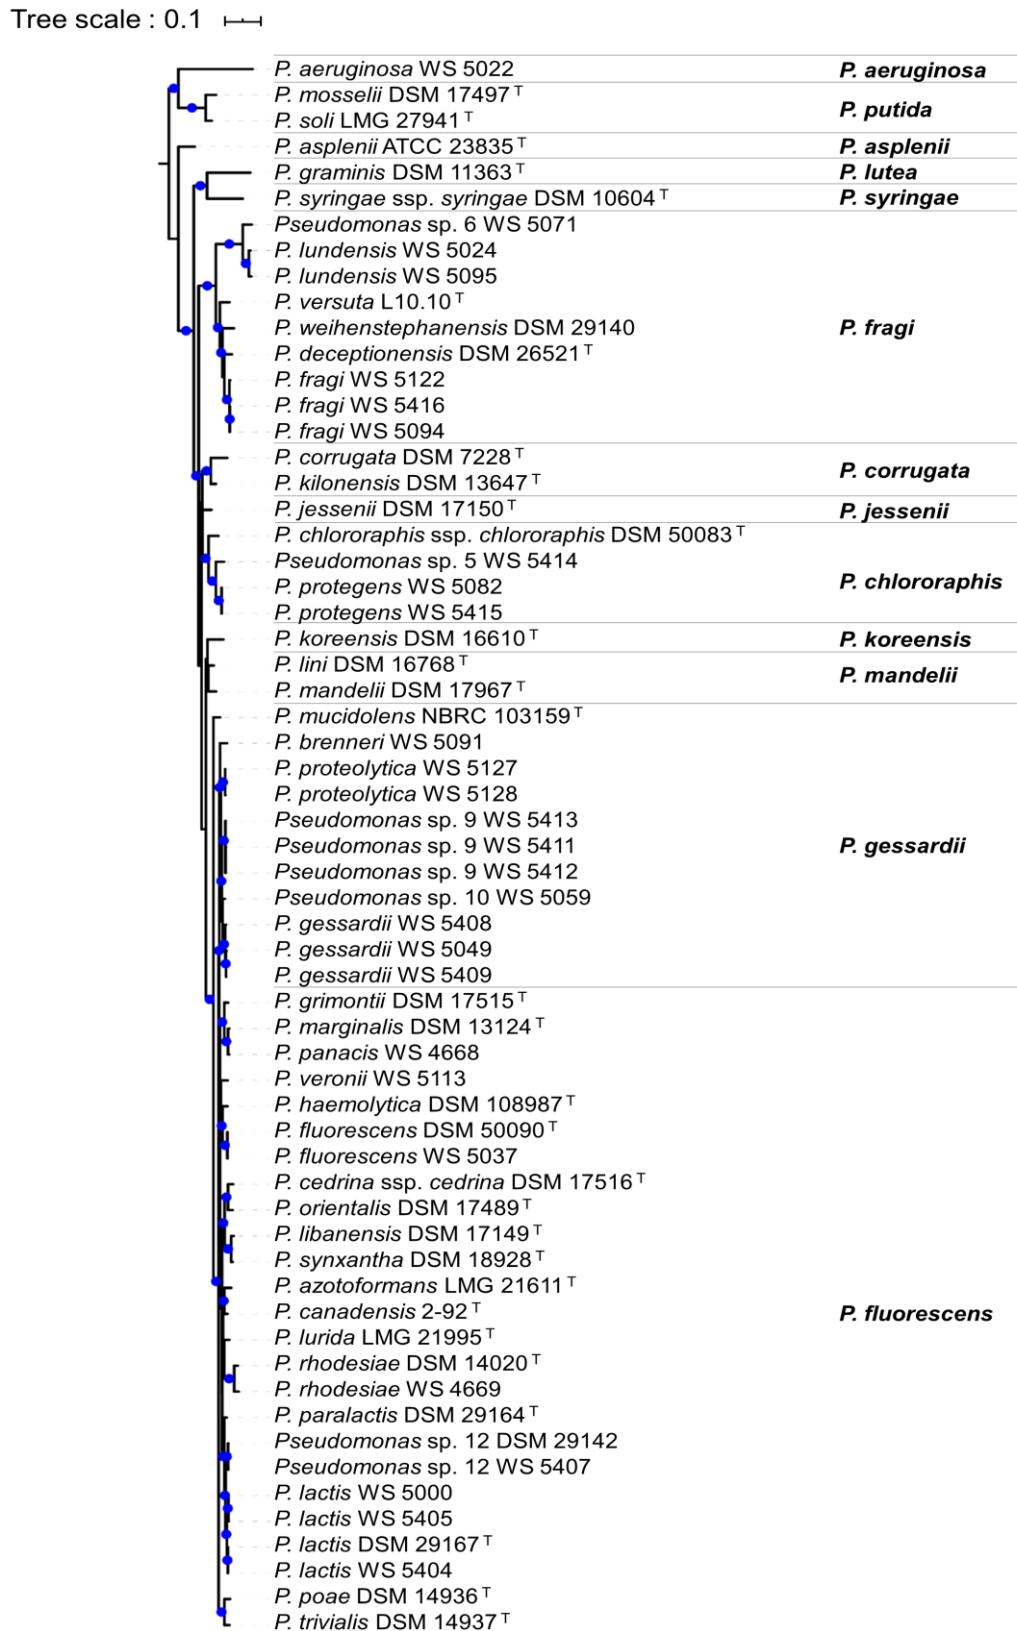

Fig S1 Rooted *rpoB* gene phylogeny comprising 61 different *Pseudomonas* strains. The tree was reconstructed on the basis of 4,074 alignment positions using the maximum likelihood method and the GTR+G+I nucleotide substitution model. *P. aeruginosa* WS 5022 was used as outgroup. Blue circles indicate branches with high bootstrap support ($\geq 70\%$ of 500 replicates). The phylogeny was separated in 13 monophyletic groups. Group names are shown in bold next to the tree

Supplementary Tables

Table S1 Bacterial strains used for evaluation of the multiplex qPCR assay. Target strains of the five species-specific hydrolysis probes (P1, P2, P3, P4 and P5) are indicated in bold print

Species	Strain	Strain collection	Origin

P4	<i>P. fragi</i>	WS 5416	X		X		X	
	<i>P. fragi</i>	WS 5112		X		X		X
P5	<i>P. lundensis</i>	WS 5095	X		X		X	
	<i>P. lundensis</i>	WS 5024		X		X		X

Table S4 Cq-values from multiplex qPCR assays, applying the six *Pseudomonas* hydrolysis probes (P1-P6) and DNA (0.1-0.2 ng/μl final concentration) from 49 *Pseudomonas* strains from 45 non-target species and isolates of 40 other bacterial species. Mean values of two technical replicates per measurement are shown. Hyphens (-) represent no signal in qPCR. C_q-values above the defined threshold of 33 were considered as not quantifiable and are given in brackets
