

Very High Risk STEMI

Hemodynamic instability or shock Life-threatening arrhythmia (unstable VT / OHCA) Mechanically complicated MI Respiratory arrest or invasive respiratory support

High Risk
Acute heart failure with the need for invasive support
Suspicion of acute or ongoing ischemia
VAD in situ OR
Scheduled VAD intervention
Resipiratory distress < 2 weeks after thoracic intervention

Intermediate Risk

Hypertensive/hormotensive acute heart failure
Chronic decompensation
Hemodynamically stable (s)VT or brady-arrhythmia
Known or suspected structural heart disease without intervention indication

General rules of triage: preference for own treating hospital when Device implantation or guiding center Congenital heart disease / aortic connective tissue disease Heart failure Arrhythmia / ablation
