

Table S3. Updated prognostic models compared to the reference method in two scenarios

	Scenario A ^a		Scenario B ^b	
	sensitivity (%)	specificity (%)	high-risk (%)	specificity (%)
<i>Reference</i> ²⁰	71	73	29	73
Gabbay-Benziv 2014 ¹⁶	69	73	31	71
Nanda 2011 ¹⁷	71	73	29	73
Teede 2011 ¹⁸	74	73	27	75
van Leeuwen 2010 ¹⁹	68	73	33	69

^a Scenario A: model sensitivity and specificity were calculated when the proportion of women considered high-risk was held constant at 29% (i.e. the proportion of women classified high-risk by the reference method).

^b Scenario B: the proportion of women classified high-risk by the model and specificity were calculated when the sensitivity was held constant at 71% (i.e. the sensitivity of the reference method).
