SI Figure and Video Captions

Figs. S1 to S12

Tables S1 to S2

SI FIGURE CAPTIONS

Fig. S1: Asymmetric unit of the SHLD3s–REV7 monomer complex and tracing of electron density of bound SHLD3s. (*A*) One asymmetric unit contains two copies of SHLD3s-REV7 monomer complex. A black box highlights the 'safety-belt' segment. *(B)* 2Fo-Fc electron density of SHLD3s at a contour level of 1σ.

Fig. S2. Visualization and intermolecular contacts involving the 'safety-belt' segment of the SHLD3s-REV7 monomer complex. (*A, B*) Two alternate views highlighting the threading of SHLD3 within a channel in the REV7 monomer associated with the 'safety-belt' concept. (*C, D*) Hydrophobic (panel *C*) and hydrogen bonding (panel *D*) interactions involving the 'safety-belt 'segment of the complex. SHLD3 residues Pro-50, Leu-51, and Arg-52 form one β strand, interacting with REV7's β6 and β7 strands (residues Val-150, Ile-172, Leu-173, and Ala-174) by backbone hydrogen bonds, assembling into an antiparallel sheet. In addition, SHLD3 Pro-53 and Pro-57 stack with Trp171 and Tyr63 of REV7 respectively, while the backbone carbonyl oxygens of SHLD3 Arg-55 and Pro-58 form two hydrogen bonds with the hydroxy groups in the side chain of REV7 Tyr-63 and Tyr-37.

Fig. S3. Location of various binding sites on the surface of REV7 monomer. (*A-C*) Location of 'site-S' (panel *A*), REV1-binding site (panel *B*) and 'PockDrug' site (panel *C*) on the β-sheet surface of REV7 monomer. Note that the two-component pocket scaffold (site-S and REV1-binding site) spanning REV7 monomer surface represents an attractive drug design target.

Fig. S4: 2Fo-Fc electron densities related to x-ray structure of SHLD2.3–REV7$_4$ complex at a contour level of 1σ. (*A*) Electron density for overall structure of SHLD2.3–REV7$_4$ complex. (*B*) Close-up view of electron density for SHLD2 in the complex. (*C*), Close-up view of electron density for SHLD3 in the complex.

Fig. S5: Cryo-EM Reconstruction of SHLD2.3–REV7$_4$–TRIP13(E253Q) complex. (*A-D*) Flow chart of image processing of SHLD2.3–REV7$_4$–TRIP13(E253Q) complex. Final 3D reconstructed maps (consensus, focused and composite) colored according to local resolution estimation with RELION3. The focused map greatly improved the density quality in SHLD2.3–REV7$_4$ segment. (*E*) Fourier Shell Correlation (FSC) curve of SHLD2.3–REV7$_4$–TRIP13(E253Q) complex and between two half maps (consensus and focused) that were calculated from two half datasets (FSC=0.143 indicated), and between the composite cryo-EM map and corresponding model (FSC=0.5 indicated).

Fig. S6. Structure of the TRIP13(E253Q) hexamer in the SHLD2.3–REV7$_4$–TRIP13(E253Q) complex. (*A, B*) Hexameric ring topology of TRIP13(E253Q) in the SHLD2.3–REV7$_4$–TRIP13(E253Q) complex shown in a ribbon (panel A) and electrostatic surface representation (panel B). ATPγS in a space-filling representation is bound to subunits A, B, C, D and E, but not F. (*C, D*) The closed folding topology of ATPγS-bound TRIP13(E253Q) subunit C and the open folding topology of ATPγS-free TRIP13(E253Q) subunit F.

Fig. S7. Cryo-EM density for interacting segments in the SHLD2.3–REV7$_4$–TRIP13(E253Q) complex. (*A*) Density for the N-terminal C-REV7 segment that inserts into the central pore of the hexameric TRIP13 ring topology. (*B*) Density for the polyE segments of TRIP13 subunits B and C. (*C*) Interaction between the αA helix of C-REV7 and finger helix 213-241 of TRIP13 A-subunit. (*D*) Interaction between loop 88-95 of O-REV7 and residues 104-127 and 230-240 of TRIP13 E-subunit.

Fig. S8: Cryo-EM study of SHLD2.3–REV7$_2$–TRIP13(E253Q) complex. (*A*) Co-purification of the complex formed by TRIP13(E253Q) hexamer and SHLD2.3–REV7$_2$ in the presence of ATPγS by size-exclusion chromatography. (*B*) SDS-PAGE analysis of fractions from size-exclusion chromatography. (*C*) The overall structure of the SHLD2.3–REV7$_2$–TRIP13(E253Q) complex with bound ATPγS shown in electron density.

Fig. S9. Key interactions between C-REV7 and TRIP13 subunit B in the structure of the SHLD2.3–REV7$_4$–TRIP13 complex. Interaction between the inserted N-terminus (Asp8 to Val14) of C-REV7 and pore loops 1 and 2 from subunit B of TRIP13 and interaction between the C-REV7 'safety-belt' and the poly-E loop of TRIP13 subunit B in the complex.
Fig. S10. Rationale for replacing SHLD2.3 by SHLD2L.3 for generating a stable dimeric REV7 complex. (*A, B*) Alignment of SHLD3 β1–SHLD2 β1–O-REV7 β6 to form a β-sheet in the SHLD2.3–REV7$_4$ (panel A, this work) and SHLD2–SHLD3–REV7 dimer (panel B, PDB 6KTO) complexes. (*C*) Sizing column elution pattern for SHLD2L.3–REV7$_2$ complex.
Fig. S11. Cryo-EM Reconstruction of SHLD2L.3–REV7$_2$–TRIP13(E253Q) complex. The numbers of particles are shown above each of the three 3D classes. 3D reconstructed maps are colored according to local resolution estimation with RELION-3. 3D classification of the particles indicates conformational flexibility of the SHLD2L.3–REV7$_2$ in the complex as also shown in Fig. 6 C and D.
Fig. S12. Structural and sequential comparison of REV7 and its paralog MAD2. (*A*) Structure of C-REV7–C-REV7 dimer mediated by REV3, as revealed by the yeast DNA polymerase ζ cryo-EM structure (PDB 6V93). *(B, C, D)* Structural comparison and superposition of REV7 conformational dimer (this work, panel B) and MAD2 conformational dimer (PDB 2V64, panel C). The two structures share a canonical dimeric architecture, with R.M.S.D=1.487 Å (panel D). *(E)* Secondary structures and structure-based sequence alignment of human REV7 and MAD2. The orange boxes highlight the loop 88-95 (site-3) and safety belt (site-4) regions that contact with TRIP13 but are not conserved between REV7 and MAD2.

Supplementary Video 1. Movie of SHLD2.3–REV7 dimer complex remodeling mediated by the ATP-driven translocation of TRIP13 hexamer. The TRIP13 hexamer is shown in ribbon representation while the SHLD2.3–REV7 dimer and ATPγS are show in space-filling representation.
